¹Household income from work refers to the sum of income received by all working members of the household from employment and business. However, it does not include the income of maids. It does not take into account net transfers from the Government.

²Resident employed households refer to households headed by Singapore citizens or permanent residents and with at least one working person.

³Based on ranking of all resident employed households by their monthly household income from work including employer CPF contributions per household member.

Note: The lowest 10% resident employed households have fewer working persons on average, a higher proportion of persons working part-time and a higher proportion of elderly persons aged 65 years and over. However, as the data cover only income from work, households could have income from non-work sources. In addition, not all households are consistently in the same decile group from one year to the next. For example, an employed household may move down from a higher decile in a particular year due to temporary unemployment of a household member, before moving up the deciles when the member resumes work in the subsequent year.
