## Appendix

## Sample Design and Sampling Variability

## Sample Design and Selection

The sample for the Census of Population 2020 was selected from a sampling frame comprising all residential dwelling units in Singapore. As the sample survey of the Census 2020 covered only households in residential dwellings, institutions such as military camps, hostels and hotels were excluded from the frame.

The sample was selected based on a stratified design. Dwelling units in the sampling frame were divided into different groups. The groups are defined based on the planning areas demarcated by the Urban Redevelopment Authority and broad dwelling type groups. A random sample was then selected from the different groups by systematic sampling with a random start. The samples selected from each group were combined to form the required sample of about 150,000 dwelling units.

## Sampling Variability

As the survey estimates are based on information obtained from a fraction of the population instead of the whole population, the precision of estimates derived from the sample survey are affected by sampling errors. Sampling errors refer to the difference between the estimate based on a sample and its 'true' population value that would result if the whole population has been surveyed.

The extent of sampling error of an estimate under a particular sample design is assessed by the variability of the estimate across all possible samples under the design. One common measure of this variability is given by the standard error (SE), which is the standard deviation of the sampling distribution of the estimate. Another measure is the relative standard error (RSE), which is obtained by expressing the standard error as a percentage to the estimate. The smaller the RSE, the more precise is the estimate.

## Generalised Sampling Errors Tables

From Table A1, the DEFT ${ }^{1}$ for most of the selected attributes ( $T_{Y}$ ) is about 1. It is impractical to compute and display the sampling error for each and every of the possible estimates such as the total number of elements in the population with a given attribute $Y$ from the Census 2020. Thus, generalized sampling errors tables are provided instead as a guide to data users for estimating the errors of any estimates.

Since most of the attributes in Table A1 have DEFT about 1, data users should generally use Table A2 (DEFT value of 1) to determine sampling errors for the attribute of interest. For attributes of individuals with larger DEFT, such as language most frequently spoken at home, data users can refer to Table A3 (DEFT value of 2).

The smaller the estimate, the larger is the RSE. This implies that sample estimates of a rare characteristic would have high RSEs and users would have to be careful in drawing inferences based on the sample estimates.

Table A1 Sampling Errors and DEFT of $\mathrm{T}_{\mathrm{Y}}$ for Selected Attributes, Census 2020

|  | Sample Estimate('000) | Standard Error$\left(T_{Y}\right)$ | Relative Standard Error <br> ( $T_{Y}$ ) | 95\% Confidence Interval ('000) |  | DEFT <br> ( $T_{Y}$ ) |

## Simple Guide on Using Relative Standard Error and Confidence Interval

To compute the $95 \%$ confidence interval of an estimate of persons with size 1,100,000 as below.

Step 1: From Table A2, the RSE of this estimate is close to $0.3 \%$

Step 2: To compute 95\% confidence interval of the estimate

Lower Confidence Interval $=1,100,000-1.96 \times 0.3 \% \times 1,100,000=1,093,532$

Upper Confidence Interval $=1,100,000+1.96 \times 0.3 \% \times 1,100,000=1,106,468$

95\% Confidence Interval $=(1,093,532,1,106,468)$
There is a $95 \%$ chance that the 'true' population value is between 1,093,532 and 1,106,468.

[^0]:    * Data pertain to residents who were not attending educational institutions as full-time students and include those who were upgrading their qualifications through part-time courses.

[^1]:    ${ }^{1}$ The DEFT is the ratio of the standard error of the estimate, under the sample design used, to that of a simple random sample. This ratio measures the effect of the complexity of the sample design on the standard error.

[^2]:    ^ 'Taoism' includes Chinese Traditional Beliefs.
