Statistical activities conducted by the Singapore Department of Statistics are governed by the provisions of the Statistics Act (Cap. 317). The Act guarantees the confidentiality of information collected from individuals and companies. It spells out the legislative authority and responsibility of the Chief Statistician. The Act is available in the Department's Website (www.singstat.gov.sg).

PREFACE

The Input-Output (I-O) tables provide a comprehensive and integrated framework for the derivation and reconciliation of key national accounts aggregates. They contain detailed information on the intricate relationships among the various economic sectors and are used for a variety of purposes such as cross-validating data from various sources, impact studies, policy formulation and evaluation.

The Singapore Department of Statistics (DOS) compiles and publishes benchmark I-O tables once every five years. This publication, containing a set of detailed Singapore I-O Tables for reference year 2005, is the eighth series of published I-O tables. It discusses the data sources and methodology, as well as the basic structure and applications of I-O tables. An Annex explaining the theoretical basis and derivation of the various I-O models and applications is also included.

The compilation of I-O tables is a massive exercise which involves consolidating voluminous data and reconciling the intermediate transaction flows of commodities through thorough analysis. DOS conducts regular methodological reviews to improve the estimates and ensure that they adhere to international guidelines. In addition, efforts have also been made to streamline and enhance the data compilation process. These improvements have resulted in a set of estimates that is more reflective of the economic structure. The more timely release of the 2005 I-O tables will also help to better meet the needs of users in analysing the recent economic structure of Singapore.

The data used in the compilation of I-O tables include both administrative and survey data. I would like to take this opportunity to extend my deep appreciation to all the government ministries and departments, statutory boards and private organisations that have contributed to the success of this publication and look forward to their continued support.

Wong Wee Kim
Chief Statistician
Singapore

June 2010

Our Vision

A National Statistical System of Quality, Integrity and Expertise.

Our Mission

**We Provide Reliable, Relevant and Timely Statistics
to Support Singapore's Social and Economic Development.**

Our Guiding Principles

Professionalism & Expertise	<i>We adhere to professional ethics and proficiently produce quality statistics that comply with international concepts and best practices.</i>
Relevance	<i>We constantly innovate our processes and produce statistics that meet users' needs.</i>
Accessibility	<i>We make our statistics readily available.</i>
Confidentiality	<i>We protect the confidentiality of information provided to us.</i>
Timeliness & Reliability	<i>We produce statistics that users can depend on and disseminate them at the earliest possible date while maintaining data quality.</i>
Cost Effectiveness	<i>We use resources effectively, minimising respondent burden and leveraging on administrative data.</i>

SINGAPORE INPUT-OUTPUT TABLES 2005

CHAPTER 1: INTRODUCTION

1.1 Input-output (I-O) tables describe and analyse the interrelationship between producers and consumers, and the interdependence among the different industries. They trace the flow of commodities, including both goods and services, from one industry to another. Such flows representing purchases and sales are set out systematically in I-O tables.

1.2 The I-O tables provide a framework for checking the consistency of data on flows of goods and services obtained from different data sources. They are used to derive and reconcile the three different approaches to Gross Domestic Product (GDP). When supplemented with relevant information, the I-O tables also provide an integrated and comprehensive framework for economic models and impact studies.

1.3 The Singapore Department of Statistics (DOS) has, to date, published seven sets of I-O tables for the reference years 1973, 1978, 1983, 1988, 1990, 1995 and 2000. The set of 2005 benchmark I-O tables is the latest in the series. Similar to earlier sets of I-O tables, they have been used to reconcile the three GDP estimates in the recently completed rebasing of Singapore's National Accounts to reference year 2005.

1.4 Chapter 2 of this publication provides information on the sources and methodology used in the compilation of the 2005 I-O tables including methodological improvements incorporated in the tables. The basic structure of the I-O tables and the main findings are described in Chapter 3. Chapter 4 discusses the various applications of the I-O tables – the multipliers and dependency analyses, forward and backward linkage as well as analysis on net foreign exchange earnings. The theoretical basis and derivation of the various I-O models and applications are explained in the Annex.

CHAPTER 2: SOURCES AND METHODOLOGY

I. Sources of Data

2.1 The main sources of data for compiling the 2005 I-O tables include surveys and censuses conducted by DOS and various government agencies (Table 1). Administrative data from relevant government departments were also used.

Table 1: Main Data Sources by Sector

Sector	Sector Description	Data Source
1	Agriculture	Census of Agriculture & Fishing Industry
2	Manufacturing	Census of Manufacturing Activities
3	Utilities	Survey of Utilities, Sewerage & Waste Management
4	Construction	Census of Construction Industry
5	Wholesale & Retail Trade	Annual Survey of Services – Wholesale Trade/ Retail Trade
6	Hotels & Restaurants	Annual Survey of Services – Hotels & Catering
7	Transport & Storage	Annual Survey of Services – Transport, Information & Communications
8	Information & Communications	Annual Survey of Services – Transport, Information & Communications
9	Financial Services	Annual Survey of Services – Financial Services Survey of Services – Financial Institutions/ Insurance Companies
10	Business Services	Annual Survey of Services – Business Services & Real Estate
11	Other Services	Annual Survey of Services – Community, Social & Personal services/ Non-Profit Organisations
12	Exports and Imports of Goods & Services	Singapore's Merchandise Trade statistics Survey of International Trade in Services

II. Methodology

2.2 The compilation of the Singapore I-O tables follows closely the concepts and principles recommended in the United Nations publication *System of National Accounts 1993*¹ (SNA93).

A. Basic Assumptions

2.3 The two basic assumptions of homogeneity and proportionality underlie the construction and use of I-O tables. The homogeneity assumption requires that each sector produces a single output with a single input structure and that there is no automatic substitution between the outputs of different sectors. The proportionality assumption states that the inputs of each sector vary in direct proportion to the output of that particular sector. In other words, this implies a constant returns to scale technology and rules out the possibilities of economies and diseconomies of scale.

2.4 Input-output coefficients refer to the physical quantities of commodities used in producing a given physical quantity of another commodity. The coefficients presented are,

¹ The United Nations recently released *System of National Accounts 2008* (SNA08).

however, in monetary terms. This is necessary because commodities are usually too heterogeneous to permit a purely physical measure. Nevertheless, it is important that the coefficients should still be interpreted in physical terms and treated as if they were technical coefficients.

B. Statistical Unit

2.5 In selecting the statistical unit, one of the most important criteria is to satisfy the two basic assumptions of homogeneity and proportionality. In addition, the statistical unit should be one whereby the input coefficients will only change if there is a change in the techniques of production. To meet these basic assumptions, the ‘establishment’ was chosen as the statistical unit for input data and the ‘commodity²’ as the unit of output data.

2.6 The establishment, as defined by the SNA93, “*is an enterprise, or part of an enterprise, that is situated in a single location and in which only a single productive activity is carried out or in which the principal productive activity accounts for most of the value-added.*” When establishments engaging in the same or similar kinds of activity are grouped together, an industry is formed. Commodities are goods and services that result from production or provision of services.

2.7 In an industry, most producer units are engaged in more than one productive activity and even one productive activity can produce multiple commodities simultaneously. Similarly, a commodity can be the principal output of one industry while being the secondary output of another industry. Therefore, a many-to-many relationship can exist between commodities and industries.

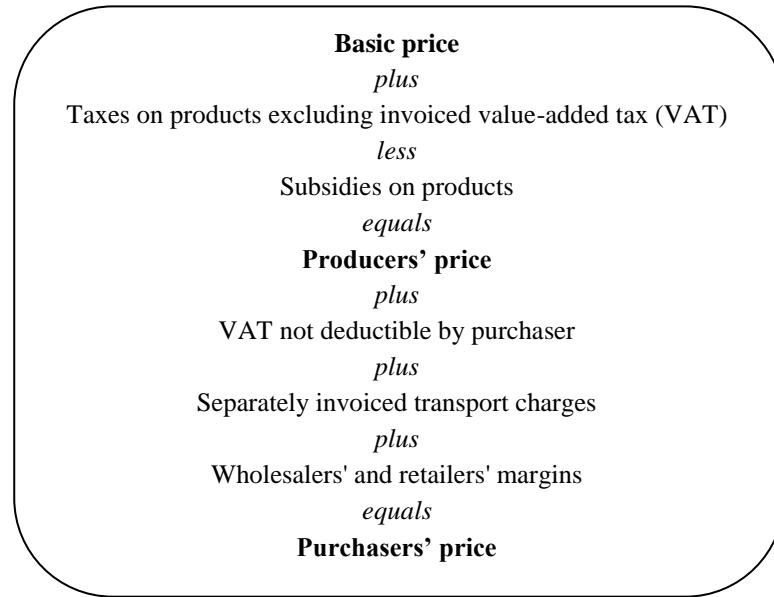

C. Valuation

2.8 It is important in input-output analysis, as in national accounting, that a consistent basis of valuation be adopted for all transactions. This will ensure that the purchase of one unit of a particular commodity by any buyer will stimulate demand to the same extent.

2.9 To ensure uniform valuation, the treatment of taxes on products and trade and transport margins has to be consistent. Firstly, when taxes are levied on outputs, i.e. taxes on products, the purchases may be valued by either basic price (excluding taxes on products) or producers’ price (including taxes on products). Secondly, there is the effect of trade and transport margins leading to the choice of producers’ price (excluding trade and transport margins) and purchasers’ price (including trade and transport margins). Exhibit 1 gives an overview of the differences between basic, producers’ and purchasers’ prices.

² The terms product and commodity are used interchangeably.

Exhibit 1: Basic, Producers' and Purchasers' Prices

2.10 In the I-O tables, all inputs and outputs are valued at basic price. Basic price is adopted as it excludes taxes on products and trade and transport margins, both of which may vary depending on the type of buyer. The trade and transport margins deducted are allocated to their own industry/commodity groups, and taxes on products are shown separately.

D. Treatment of Imports and Exports

2.11 When an I-O table is used to determine the output of commodities required to meet a given level of final demand, it is useful to be able to extend the analysis to determine the proportions in which the required supplies of the various commodities are produced domestically or imported.

2.12 Goods that are imported and then subsequently re-exported without being processed are omitted in the compilation of the Singapore I-O tables. Imports are valued at cost, insurance, freight (c.i.f.) at the domestic customs frontier by customs. This valuation basis has resulted in the inclusion of freight and insurance payments made to local carriers and insurance firms which need to be excluded. An adjustment is made on the exports of such services by domestic producers. In this way, no negative entries for transport and insurance services would appear in the import matrix.

2.13 Exports are valued free on board (f.o.b.) i.e., at the prices at the domestic customs frontier before being shipped out. They are valued at basic price at the border of Singapore. The trade and transport margins are reflected in the respective trade and transport industries as exports. Re-exports, as mentioned in the preceding paragraph, are not recorded in the I-O tables.

III. Methodological Improvements

2.14 As Singapore's benchmark I-O tables form an integral part of the rebasing of Singapore's National Accounts, conceptual changes and methodological improvements are often introduced and incorporated into the I-O tables during rebasing. One of the main improvements implemented in the 2005 I-O tables is the measurement of the implicit charges for financial services produced by financial intermediaries, also known as financial intermediation services indirectly measured (FISIM)³. Financial intermediaries charge for their services indirectly by offering lower rates of interest to depositors and levying higher interest rates on borrowers.

2.15 DOS had previously adopted the methodology recommended in *A System of National Accounts* published by the United Nations in 1968 (SNA68) to estimate these implicit service charges, which was known as imputed bank service charge (IBSC) and recorded as the intermediate consumption of a nominal industry in the earlier I-O tables.

2.16 Following the recommendation of the SNA93/SNA08 to estimate FISIM using the reference rate approach, the implicit charges for financial services provided by financial intermediaries associated with loans and deposits are recorded in the 2005 I-O tables as part of the output of industries under the I-O industry Banks & Finance Companies, while being considered as intermediate consumption for the other industries and as final demand by households, government and non-residents.

2.17 In addition to FISIM, implicit charges of financial services provided by financial intermediaries associated with the acquisition and disposal of debt securities are also estimated based on the difference between the buying (bid) and selling (offer) prices for the securities and the mid-points of the buying and selling prices, as identified by SNA08. Similar to FISIM, these implicit charges were also allocated to intermediate and final users that consumed these services.

2.18 With the implementation of FISIM as well as the refinement on implicit service charges associated with the transaction of debt securities, the IBSC as a nominal industry no longer exists and therefore the IBSC column has been removed from the absorption matrix of the 2005 I-O tables.

³ Please refer to the Information Paper: Rebasing of Singapore's National Accounts to Reference Year 2005 (DOS 2010) for a more detailed discussion on the implicit charges for financial services.

CHAPTER 3: BASIC STRUCTURE OF INPUT-OUTPUT TABLES

3.1 The Singapore I-O tables comprise three basic matrices namely the make matrix, absorption matrix and import matrix. These three tables bring together the production, expenditure and income measures of GDP and form the basis from which all other symmetric tables and applications in this publication are generated.

3.2 The 2005 benchmark I-O tables have been compiled to analyse 136 industrial sectors and commodities. The industrial classification is based on the 2005 Singapore Standard Industrial Classification (SSIC 2005) while the commodity classification follows the Standard International Trade Classification, Rev.3 (SITC Rev.3) and Harmonised Commodity Description and Coding System Nomenclature 2002 (HS 2002). To improve readability and allow for easy understanding, the tables in this paper have been aggregated into 12 industrial sectors and commodities⁴.

I. Make Matrix

3.3 The make matrix records the domestic output of all industries by commodity. Exhibit 2 provides a schematic representation of the make matrix. The total of each row gives the total output of an industry and the total of each column, the output of a particular commodity. All entries are valued at basic price, i.e. exclusive of any taxes, subsidies, and trade and transport margins.

3.4 The diagonal entries of the make matrix always show a higher value vis-à-vis the off-diagonal entries. This reflects the principal commodities produced by establishments in that industrial sector. However, it is also common for establishments to engage in the production of secondary products and this explains the existence of the off-diagonal entries in the make matrix.

Exhibit 2: Schematic Representation of Make Matrix

	Commodity	Total
Industry	X_Q	Q_I
Total	Q_C	Q_D

Notation:

- X_Q : Make matrix recording the values of domestically produced commodities by industry
 Q_I : Column vector of total output by industry
 Q_C : Row vector of total output by commodity
 Q_D : Total domestic output

⁴ The correspondence between the 12 industrial sectors and commodities, and the detailed 136 I-O industries and commodities is found in Appendix 2.

3.5 In 2005, the Singapore economy produced \$563.3 billion worth of goods and services (Table 2). The services sector⁵ accounted for 53 per cent of total domestic output while the goods sector contributed to the remaining 47 per cent. The manufacturing sector continued to be the major industry, accounting for 40 per cent of total domestic output.

II. Absorption Matrix

3.6 The second basic table, which is referred to as the absorption matrix, records the commodities purchased or used by industries as intermediate inputs to current production. A convention in I-O tables is to present other relevant information together with the absorption matrix. A schematic representation is shown in Exhibit 3.

Exhibit 3: Schematic Representation of Absorption Matrix and Related Matrices

	Industry	Final Demand	Total
Commodity	X_A	F_L	Q_C
Imports	R_M	R_{FM}	M
Taxes on Products	R_T	R_{FT}	T
Gross Value-Added at Basic Price	X_Y		Y
Total	Q_I	F	Q

Notation:

- X_A : Absorption matrix recording the values of domestically produced commodities purchased by industry
- F_L : Matrix of final demand for domestically produced commodities
- Q_C : Column vector of total domestically produced commodities
- R_M : Row vector of total imports purchased by industry
- R_{FM} : Row vector of final demand for imports
- M : Total imports
- R_T : Row vector of taxes on products by industry
- R_{FT} : Row vector of taxes on products by final demand
- T : Total taxes on products
- X_Y : Matrix of gross value-added components at basic price by industry
- Y : Column vector of factor income
- Q_I : Row vector of total input by industry
- F : Row vector of total final demand
- Q : Total Output = Total Input

⁵ The services sector includes wholesale and retail trade, hotels and restaurants, transport and storage, information and communications, financial services, business services, and other services while the goods sector includes the agriculture, manufacturing, utilities and construction industries.

3.7 To the right of the absorption matrix is the final demand matrix which records the use of various commodities by final demand categories such as private consumption expenditure (PCE), government consumption expenditure (GCE), gross fixed capital formation (GFCF), change in inventories, and exports of goods and services. Retained imports used as intermediate inputs or by final demand are shown as a separate row vector below these matrices. The next row vector represents taxes on products; following which, is a matrix of gross value-added (GVA) components at basic price. This systematic way of presentation reveals very clearly the reconciliation of GDP by the three approaches, viz., production approach, expenditure approach and income approach (Exhibit 4).

Exhibit 4: Derivation of GDP at Current Market Prices

Production Approach

$$\begin{aligned} \text{GDP} &= \text{Output} - \text{Intermediate Inputs} + \text{Taxes on Products} \\ &\quad \text{by Final Demand} \\ &= Q_I - X_A - R_M + R_{FT} \end{aligned}$$

Expenditure Approach

$$\begin{aligned} \text{GDP} &= \text{Total Final Demand} - \text{Total Imports} \\ &= F - M \end{aligned}$$

Income Approach

$$\begin{aligned} \text{GDP} &= \text{Sum of Factor Income} + \text{Total Taxes on Products} \\ &= Y + T \end{aligned}$$

Table 2: Make Matrix, 2005

Note: Figures may not add up to the total due to rounding.

3.8 In 2005, the total intermediate inputs supplied by domestic industries amounted to \$161.3 billion representing 29 per cent of total domestic production (Table 3). The services sector continued to account for a larger share of 63 per cent and the goods sector, the remaining 37 per cent. The manufacturing industry remained the single most important industry, contributing 24 per cent of all domestically produced inputs of which 46 per cent were consumed by the industry itself. The amount of goods and services imported by domestic industries for use in their production process was \$202.4 billion in 2005.

3.9 Final demand components, namely, PCE, GCE, gross capital formation⁶ and exports of goods and services absorbed \$402.0 billion or 71 per cent of total domestic output in 2005. Exports of goods and services continued to account for the major proportion of domestic output. Of the \$563.3 billion of total domestic output in 2005, exports of goods and services accounted for \$298.9 billion or 53 per cent of total domestic output, reflecting the economy's high dependency on external demand.

Chart 1: Gross Value-Added at Basic Price, 2005

⁶ Gross capital formation is made up of gross fixed capital formation and change in inventories.

Table 3: Absorption Matrix, 2005

Sales by Commodity		Purchases by Industry											Million Dollars		
		Agriculture	Manufacturing			Utilities	Construction	Wholesale & Retail Trade	Hotels & Restaurants	Transport & Storage	Information & Communications	Financial Services	Business Services	Other Services

Note: Figures may not add up to total due to rounding

3.10 GVA in 2005 amounted to \$199.3 billion which was about 35 per cent of total domestic output. Chart 1 shows the GVA by at basic price by sectors. The non-oil manufacturing sector had the highest GVA of \$48.7 billion in 2005 followed by the wholesale and retail trade sector which generated GVA of \$34.4 billion. The agriculture sector had the lowest GVA of \$0.1 billion in 2005.

3.11 Compensation of employees in 2005 was \$83.9 billion which was about 42 per cent of GVA. Chart 2 shows the percentage distribution of GVA components, namely compensation of employees (wages), gross operating surplus and taxes on production, by sectors. The construction sector's wage share of 72 per cent of GVA was the highest in 2005 while the wage share of the oil manufacturing sector was the lowest at 8 per cent.

III. Import Matrix

3.12 Similar to the absorption matrix, the import matrix records the retained imports by commodity entering industries as intermediate inputs and the final demand sectors as consumption or capital formation; it is an expansion of the row vector of retained imports in Table 3. Exhibit 5 is a schematic representation of the import matrix.

Exhibit 5: Schematic Representation of Import Matrix

	Industry	Final Demand	Total
Commodity	X_M	F_M	Q_M
Total	R_M	R_{FM}	M

Notation:

X_M : Import matrix recording the values of imported commodities by industry

F_M : Matrix of final demand for imported commodities

Q_M : Column vector of total commodities imported

R_M : Row vector of total imports purchased by industry

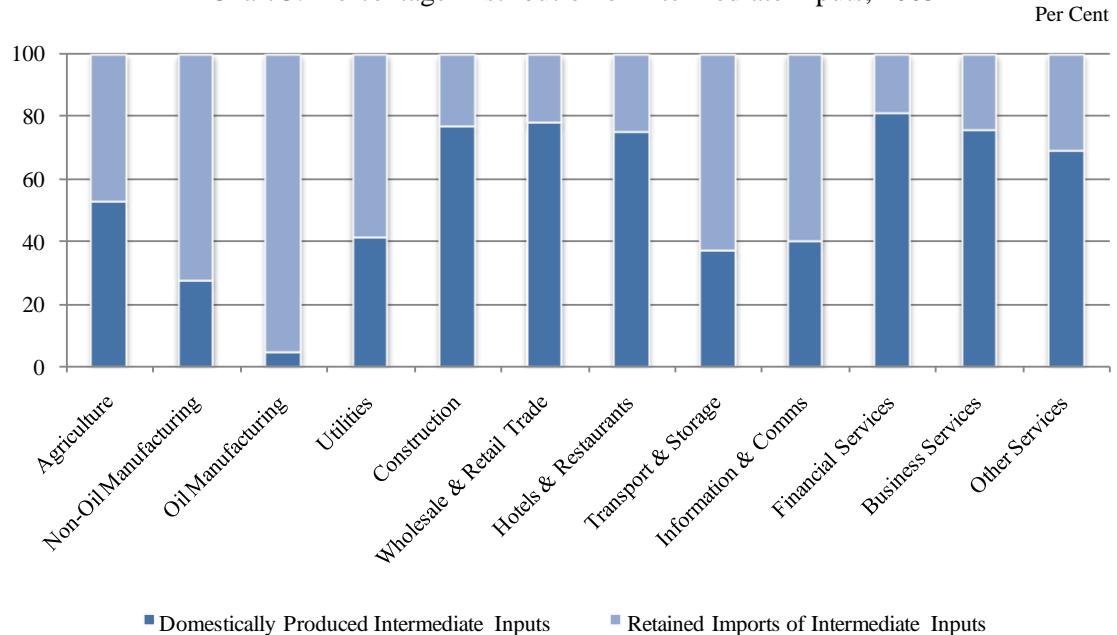

R_{FM} : Row vector of final demand for imports

M : Total imports

3.13 Total imports of goods and services in 2005 was \$237.5 billion (Table 4) of which \$202.4 billion was purchased by industrial sectors as inputs for their production, with only \$35.1 billion retained for final demand. The bulk of the imported inputs were manufacturing commodities which made up 61 per cent of total retained imports. Chart 3 shows the distribution between domestically produced and imported inputs used by industrial sectors for production.

3.14 The import matrix also captured data on residents' expenditure abroad net of tourists' expenditure under "Other Services" in the PCE column. The positive entry implies that residents' expenditure abroad exceeded tourists' expenditure in Singapore by \$2.8 billion in 2005.

Chart 3: Percentage Distribution of Intermediate Inputs, 2005

■ Domestically Produced Intermediate Inputs

■ Retained Imports of Intermediate Inputs

Table 4: Import Matrix, 2005

Import by Commodity	Purchases by Industry												Total intermediate output	Million Dollars

IV. Symmetric Tables

3.15 The I-O tables discussed in this chapter show the flows of commodities to and from industries and to final demand. In order to use these tables for analytical purposes, it is necessary that Table 3 be expressed in a symmetrical form, which shows either the purchases of industrial output by industries and final demand, or the purchases of commodities by commodity production process. These symmetric tables are known as *industry-by-industry* tables or *commodity-by-commodity* tables. The symmetric tables used in the applications of I-O tables in this publication are *industry-by-industry* tables.

3.16 To construct *industry-by-industry* tables, commodity purchases by each industry are adjusted so that industries are shown as purchasing industry's output rather than commodities. To construct *commodity-by-commodity* tables, each industry's inputs are divided into those commodities it produces. These are then aggregated for each commodity to form commodity production accounts. In both cases, it is necessary to make assumptions about the structure of production in each industry, which concern technologies of production.

3.17 The first is the industry technology assumption. An industry is said to satisfy the industry technology assumption if the inputs used in the production of each of its non-principal products are in the same proportion as those used in the production of its principal product. In other words, all products produced by the particular industry have the same input structure. Under the industry technology assumption, the coefficients showing how commodities are produced are assumed to depend on the industry in which they are produced.

3.18 The second is the commodity technology assumption. An industry is said to satisfy the commodity technology assumption if the inputs used in the production of each of the commodities it produces are the same as those used in other industries producing identical commodities. In other words, each commodity is produced in its own specific way irrespective of the industry in which it is produced. Under the commodity technology assumption, this will mean that the coefficients showing how manufactured commodities are produced are those of the manufacturing industry regardless of which industry they are actually produced in.

3.19 The technology assumption adopted in our *industry-by-industry* and *commodity-by-commodity* tables is based on the hybrid technology assumption which is a mixture of the industry and commodity technology assumptions.

CHAPTER 4: APPLICATIONS OF INPUT-OUTPUT TABLES

4.1 This chapter presents and explains some applications of I-O tables viz., multipliers, dependencies, linkages as well as net foreign exchange earnings. The mathematical derivation of the symmetric tables and applications are explained in the Annex. There is also a brief discussion on the impact of the various final demand components on the Singapore economy. As the tables have been aggregated into 12 sectors, some of the figures in this paper may differ slightly from the corresponding estimates in the detailed tables due to aggregation bias⁷.

I. Multiplier Analysis

4.2 An important tool for economic analysis is the input-output multiplier. Multipliers provide a relative measure of the interdependence between one industry and the rest of the economy arising solely from the purchases and sales of industry output. A multiplier is a ratio that measures the impact on the total economy as a result of an initial autonomous change in any of the final demand components. The relationship between the initial autonomous change and the total effects on the entire economy generated by the change is known as the multiplier effect.

4.3 The effects of the multiplier can be illustrated by the sequence of events that follow after the initial autonomous change. For example, an increase in the final demand for computer notebooks will increase the production of notebooks. To produce more notebooks, the manufacturers will have to purchase more components such as liquid crystal display (LCD) screens and hard disks, etc. This in turn leads to an increase in LCD screens production. The LCD screen manufacturers will also require more raw materials, such as microelectronic chips etc., to meet increased production needs.

4.4 This process will continue and all industries supplying the components and services to the manufacturers of computer notebooks will have to purchase more goods and services from their own suppliers so as to increase production. Therefore, the increase in demand for computer notebooks does not end at the production of computer notebooks per se; it will generate a series of events.

4.5 Different multipliers can be generated depending on the purpose of analysis. The most commonly used multipliers are output, value-added, income, import and employment multipliers. For comparative purposes, multipliers are usually expressed with respect to a unit of autonomous change in final demand (Exhibit 6).

4.6 The multipliers listed above can be generated from two different models: open and closed. The intrinsic difference between them is the assumption and treatment of household income and PCE. In the open model, all final demand components are assumed to be exogenous and only the production-induced effects resulting from a change in these final demand components are captured. Conversely, in the closed model, the household sector is treated as endogenous to the system. As a result, in addition to the production-induced effects, the consumption-induced effects are also accounted for in this model.

⁷ Aggregation bias in analytical I-O tables arises when these tables are computed from aggregated versions of basic tables. Some of the information in the detailed tables may be ‘lost’ in the aggregation process, leading to slight differences when comparing disaggregated and aggregated versions of the same table.

Exhibit 6: Explanation of Multipliers

Multiplier of Industry A	Per Million Dollar Change in Final Demand	Interpretation
Output	\$1.28m	A \$1m increase in the final demand of Industry A would:
Value-Added	\$0.36m	Increase output of the whole economy by \$1.28m
Income	\$0.15m	Increase value-added of the whole economy by \$0.36m
Import	\$0.64m	Increase income of the whole economy by \$0.15m
Employment	5 persons	Increase imports of the whole economy by \$0.64m
		Increase employment of the whole economy by 5 persons

4.7 The multipliers generated using the open model are known as simple or Leontief multipliers and they measure both the direct and indirect effects of a change in final demand. The model is described as open because there are leakages from the system at each round of the multiplier process. These leakages include payments for imports and primary inputs and the recipients are assumed to make no use of their receipts.

4.8 In the case of the closed model, the multipliers generated are known as total or Leontief-Keynes multipliers. The household sector receiving income from the work done in the production process would spend some of this income on local products. This increase in consumption would in turn increase the level of output of the products which implies that besides the direct and indirect effects, the closed model also captures the induced effect. Therefore, total multipliers in the closed model are always higher than the simple multipliers in the open model.

A. Simple Multipliers (Open Model)

4.9 Table 5 shows the simple multipliers of the 12 industrial sectors generated from the 2005 I-O tables.

Table 5: Simple Multipliers by Industrial Sector Per Million Dollar Change in Final Demand, 2005

Industrial Sector	Output	Value-Added	Income	Import	Employment
					Number
Agriculture	1.416	0.640	0.291	0.357	16.7
Manufacturing (Non-Oil)	1.279	0.371	0.126	0.628	3.5
Manufacturing (Oil)	1.058	0.135	0.019	0.864	0.3
Utilities	1.392	0.450	0.079	0.540	2.0
Construction	2.176	0.554	0.336	0.446	14.9
Wholesale & Retail Trade	1.539	0.737	0.298	0.262	7.2
Hotels & Restaurants	1.614	0.708	0.375	0.291	16.4
Transport & Storage	1.349	0.465	0.165	0.534	4.1
Information & Communications	1.383	0.507	0.234	0.492	4.4
Financial Services	1.726	0.779	0.354	0.220	4.8
Business Services	1.538	0.759	0.351	0.240	8.2
Other Services	1.514	0.726	0.415	0.272	11.9

4.10 The output multiplier for the construction sector was 2.176, the highest of all sectors in 2005. In other words, an increase in demand for the construction sector's output would stimulate a relatively high level of domestic production in the whole economy.

4.11 A decomposition of the output multiplier for the construction sector shows that the value-added (VA) and import multipliers were 0.554 and 0.446 respectively, with the remaining 1.176 accrued to intermediates. This means that a dollar increase in the final demand of the construction sector would eventually lead to 55 cents of VA being generated for the whole economy. A further breakdown of the VA multiplier shows that 34 cents would eventually be returned to workers as remuneration.

4.12 While the output multiplier measures the amount of output stimulated in the whole economy, the VA multiplier provides an estimate of the corresponding VA created in the process. Services output was more dependent on domestic industries for its input requirements. As a result, more VA was generated in the economy by the consumption of services output than that of manufactured goods.

4.13 In 2005, a dollar increase in consumption in the financial services and business services sectors would help to generate 78 cents and 76 cents of VA in the whole economy respectively, the highest among all industries. In contrast, a dollar increase in expenditure on non-oil manufactured goods would result only in 37 cents of VA in the whole economy.

4.14 The income and employment multipliers for the utilities and oil manufacturing sectors were lower than most other sectors, indicating that both sectors were relatively less labour intensive. Therefore, their contribution of remuneration to VA would be relatively lower with lower wage shares in their VA. The income and employment multipliers for the hotels and restaurants, and other services sectors were among the highest in 2005, reflecting the highly labour intensive nature of these industries.

4.15 The oil manufacturing sector had the highest import multiplier of 0.864, i.e. the oil manufacturing sector required 86 cents of imports for every dollar of output produced. The oil manufacturing sector's products had higher import content, and the VA multiplier of the oil manufacturing sector was relatively lower than the other sectors.

4.16 As mentioned in the earlier section, the open model measures both the direct and indirect effects of a change in final demand. Table 6 illustrates these effects through the VA and import multipliers.

4.17 The VA multiplier of the financial sector in 2005 was 0.779. Of the 78 cents of VA generated in the total economy from a dollar increase in financial services consumed, the direct VA contribution to the financial sector was 46 cents while the remaining 32 cents was the additional VA generated in the industries which supplied goods and services to the sector.

Table 6: Direct and Indirect Effects of Value-Added & Import Multipliers by Industrial Sector
Per Million Dollar Change in Final Demand, 2005

Industrial Sector	Value-Added			Import		
	Multiplier	Direct	Indirect	Multiplier	Direct	Indirect
		Million Dollars				
Agriculture	0.640	0.467	0.172	0.357	0.249	0.108

B. Total Multipliers (Closed Model)

4.18 Table 7 presents the total multipliers of the 12 industrial sectors. The rankings of total multipliers are different from that of simple multipliers generated from the open model. For the simple VA multipliers, the top three sectors with the highest simple VA multipliers were wholesale and retail trade, financial services and business services, while the top three sectors with the highest total VA multipliers were financial services, other services and business services. Despite this, the rankings of simple and total multipliers are correlated because the production-induced effects (direct and indirect effects) reflected by the simple multipliers are also embedded within the total multipliers.

Table 7: Total Multipliers by Industrial Sector Per Million Dollar Change in Final Demand, 2005

Industrial Sector	Output	Value-Added	Income	Import	Employment
					Number
Agriculture	1.793	0.806	0.373	0.440	19.0
Manufacturing (Non-Oil)	1.442	0.443	0.161	0.664	4.5
Manufacturing (Oil)	1.083	0.146	0.024	0.869	0.5
Utilities	1.495	0.495	0.101	0.562	2.6
Construction	2.611	0.746	0.431	0.542	17.5
Wholesale & Retail Trade	1.925	0.908	0.382	0.347	9.6
Hotels & Restaurants	2.100	0.922	0.481	0.398	19.3
Transport & Storage	1.563	0.560	0.212	0.581	5.4
Information & Communications	1.687	0.641	0.300	0.559	6.2
Financial Services	2.185	0.981	0.454	0.321	7.6
Business Services	1.992	0.960	0.449	0.340	11.0
Other Services	2.052	0.963	0.532	0.390	15.2

4.19 The difference between the multipliers generated by the closed and open model is attributed to the consumption-induced effect. Table 8 shows the consumption-induced effect of the different industrial sectors. It is observed that the more labour intensive industries, such as the hotels and restaurants sector, exhibited higher consumption induced effects as wage shares were generally higher in these industries. An increase in income as a result of generating an increase in output would in turn lead to further spending by the wage earners, and consequently additional consumption-induced effects in the production process.

Table 8: Consumption-Induced Effects by Industrial Sector
Per Million Dollar Change in Final Demand, 2005

Industrial Sector	Output	Value-Added	Income	Import	Employment
	Million Dollars				Number
Agriculture	0.377	0.166	0.082	0.083	2.3
Manufacturing (Non-Oil)	0.163	0.072	0.035	0.036	1.0
Manufacturing (Oil)	0.025	0.011	0.005	0.005	0.1
Utilities	0.102	0.045	0.022	0.022	0.6
Construction	0.436	0.192	0.095	0.096	2.6

Other Services	0.538	0.237	0.117	0.118	3.3

II. Dependency Analysis

4.20 Multiplier analysis is only able to give us the impact on the entire economy. However, in policy-making, it is important not only to know the impact of an autonomous change on the total economy but also the impact on specific sectors. Dependency analysis is used to show how the multiplier effect is spread out among the different sectors of the economy. Table 9 shows the VA dependencies of the 12 industrial sectors in the open model.

Table 9: Value-Added Dependency Per Million Dollar Change in Final Demand, 2005

Industrial Sector	Value-Added Multiplier	Impact On			
		Itself	Others	Itself	Others
	Million Dollars	Million Dollars	Per Cent		
Agriculture	0.640	0.474	0.165	74	26
Manufacturing (Non-Oil)	0.371	0.296	0.075	80	20
Manufacturing (Oil)	0.135	0.112	0.023	83	17
Utilities	0.450	0.401	0.049	89	11
Construction	0.554	0.349	0.204	63	37
Wholesale & Retail Trade	0.737	0.538	0.200	73	27
Hotels & Restaurants	0.708	0.452	0.256	64	36
Transport & Storage	0.465	0.398	0.068	85	15
Information & Communications	0.507	0.386	0.121	76	24
Financial Services	0.779	0.676	0.103	87	13
Business Services	0.759	0.607	0.153	80	20
Other Services	0.726	0.535	0.191	74	26

Note: Figures may not add up to the total due to rounding.

4.21 The construction sector had the highest impact on the VA of the other sectors in 2005. For a dollar increase in the final demand of the construction sector, 37 per cent of the increase in the VA generated in the total economy would benefit other sectors. Conversely, if the construction sector was affected by a decrease in final demand, the spillover to other sectors would be relatively large. On the other hand, a change in final demand of the utilities sector would have the least relative impact on the VA of other sectors.

III. Linkage Analysis

4.22 Another application of I-O tables is linkage analysis. Linkage analysis provides an average measure of the potential stimulus to other sectors from investment in a particular sector. Linkages can be viewed from a demand as well as supply perspective.

4.23 Backward linkages capture the changes in output that occur in supplying sectors when there is a change in demand from the sector using the supplying sectors' outputs as inputs. For example, an increase in demand for the output of manufacturing sector would require the manufacturing sector to source for more inputs. This would in turn increase the output of the sectors from which the manufacturing sector purchases its inputs. This is the direction of causation from the demand side perspective and is known as backward linkage.

4.24 Forward linkages capture the changes in output when there is a change in the sectors supplying inputs. For example, an increase in the primary inputs or imports of the manufacturing sector would imply additional amounts of manufacturing output are available to be used by other sectors for their production. This is the direction of causation from the supply-side perspective and is known as forward linkage.

4.25 A backward linkage greater (less) than one implies that the industry in question has an above (below) average dependency on all domestic industries for its input requirements. On the other hand, a forward linkage greater (less) than one implies that overall domestic industries have an above (below) average dependency on the industry in question for their input requirements.

4.26 Linkage analysis is useful for identifying key sectors of the economy and for grouping sectors into spatial clusters⁸. However, high backward and forward linkages in any sector are not sufficient conditions for all producing and purchasing sectors in an economy to benefit when that sector expands.

4.27 A coefficient of variation can be computed to measure whether a linkage is biased towards only a few sectors. A low coefficient of variation in a particular sector means that investment in that particular sector would stimulate other sectors in an even manner. Conversely, a high coefficient of variation means that the benefits of investment in a particular sector are unevenly shared among all sectors. Table 10 shows the linkages and coefficients of variation for the 12 industrial sectors.

⁸ It is important to note that linkages are sensitive to how the industrial sectors are grouped. If the sectors are grouped in a way that they are self-sufficient, then the linkages with other sectors will be small. This is because the source of inputs and the use of output occur within the industries of that sector.

Table 10: Backward and Forward Linkages, 2005

Industrial Sector	Backward		Forward	
	Linkage	Coefficient of Variation	Linkage	Coefficient of Variation
Agriculture	0.945	2.405	0.820	2.698
Manufacturing (Non-Oil)	0.853	2.952	0.753	3.226
Manufacturing (Oil)	0.706	3.268	0.666	3.320
Utilities	0.929	3.125	1.387	1.957
Construction	1.452	2.619	1.155	3.204
Wholesale & Retail Trade	1.027	2.271	0.850	2.624
Hotels & Restaurants	1.077	2.102	0.873	2.511
Transport & Storage	0.900	3.015	1.039	2.490
Information & Communications	0.923	2.737	1.248	1.882
Financial Services	1.152	2.932	1.226	2.607
Business Services	1.026	2.520	1.207	2.017
Other Services	1.010	2.331	0.774	2.970

4.28 The information and communications, and utilities sectors had two of the highest forward linkages with the lowest coefficients of variation, indicating that the services provided by these two sectors are essential to all other domestic industries in the economy. On the other hand, the oil manufacturing sector had the lowest forward linkage with the highest coefficient of variation, indicating that the use of its output as intermediate inputs may be specific to a few sectors.

4.29 The construction and financial services sectors had the highest backward linkages in 2005 and they also had the highest output multipliers as backward linkages are proportional to output multipliers. A high backward linkage suggests that a sector is highly dependent upon other domestic industries for its input requirements. Conversely, both the non-oil and oil manufacturing sectors had the lowest backward linkages, indicative of their relatively high dependency on imported inputs.

IV. Net Foreign Exchange Earnings

4.30 Total domestic exports accounted for 53 per cent of domestic production in 2005. The ratio of the import content of domestic exports to Singapore's domestic exports was also equally high at 56 per cent. These indicated Singapore's high dependency on both external demand and supply.

4.31 I-O tables can be used to generate net foreign exchange earnings by industrial sector. Net foreign exchange earnings are defined as total foreign exchange earnings from domestic exports minus the import requirements to produce the exports. The ratio of net foreign exchange earnings to total domestic export gives an indication of the VA generated from domestic exports. Table 11 shows the net foreign exchange earnings of the 12 industrial sectors.

Table 11: Net Foreign Exchange Earnings from Exports, 2005

Industrial Sector	Exports	Import Requirements for Exports	Net Foreign Exchange Earnings		
	Million Dollars		Million Dollars	Percentage Distribution	Percentage of Exports
Agriculture	130.6	46.6	84.0	0.1	64.3
Manufacturing (Non-Oil)	150,996.7	94,831.9	56,164.8	42.6	37.2
Manufacturing (Oil)	40,821.6	35,271.5	5,550.1	4.2	13.6
Utilities	649.2	350.5	298.7	0.2	46.0
Construction	847.7	378.1	469.6	0.4	55.4
Wholesale & Retail Trade	42,986.7	11,254.5	31,732.2	24.1	73.8
Hotels & Restaurants	151.2	44.0	107.2	0.1	70.9
Transport & Storage	30,101.9	16,074.1	14,027.8	10.7	46.6
Information & Communications	5,975.3	2,941.3	3,034.0	2.3	50.8
Financial Services	15,525.0	3,409.6	12,115.4	9.2	78.0
Business Services	10,050.8	2,411.8	7,639.0	5.8	76.0
Other Services	643.1	174.8	468.3	0.4	72.8
TOTAL	298,880.0	167,188.8	131,691.2	100.0	44.1

Note: Figures may not add up to the total due to rounding.

4.32 The non-oil manufacturing sector contributed \$56.2 billion worth of net foreign exchange earnings, which was the highest among the 12 sectors. This reflected a primarily export oriented industry with a high ratio of exports to domestic production. However, its percentage of net foreign exchange earnings to total domestic exports was relatively lower than that of the services sectors, implying that its contribution to VA was not as much as the latter. Generally, the import content of services was relatively lower, which resulted in higher VA per unit of exports.

V. Impact of Final Demand

A. On Output

4.33 Different components of final demand have different impact on output. Output generated in the various industries as a result of a dollar change in each final demand component is presented in Table 12.

4.34 In 2005, GCE had the greatest impact on the output of the economy followed by exports – every dollar increase in GCE and exports would generate \$1.51 and \$1.33 worth of output respectively. Every dollar increase in PCE would lead to \$1.01 of output being generated, of which 8 cents were from the manufacturing sector, 4 cents from the utilities sector, and the rest of the 89 cents from the construction, wholesale and retail trade, and services sectors.

Table 12: Industrial Composition Per Dollar Change in Final Expenditure in terms of Gross Output, 2005

Industrial Sector	Private consumption expenditure	Government consumption expenditure	Gross capital formation	Exports	Dollars
Agriculture	0.00	0.00	0.00	0.00	0.00
Manufacturing (Non-Oil)	0.07	0.05	0.11	0.57	
Manufacturing (Oil)	0.01	0.00	0.00	0.14	
Utilities	0.04	0.03	0.01	0.02	
Construction	0.01	0.03	0.63	0.01	
Wholesale & Retail Trade	0.11	0.06	0.11	0.17	
Hotels & Restaurants	0.09	0.01	0.01	0.01	
Transport & Storage	0.10	0.04	0.04	0.17	
Information & Communications	0.06	0.05	0.06	0.05	
Financial Services	0.13	0.06	0.04	0.11	
Business Services	0.12	0.12	0.12	0.08	
Other Services	0.28	1.05	0.01	0.02	
TOTAL	1.01	1.51	1.14	1.33	

Note: Figures may not add up to the total due to rounding.

B. On Value-Added

4.35 Table 13 shows the VA generated in each industry by categories of final demand. In 2005, PCE generated \$37.5 billion worth of VA. This comprised \$1.7 billion from the manufacturing sector, \$1.0 billion from the utilities sector, \$0.2 billion from the construction sector, \$4.6 billion from the wholesale and retail trade sector, and \$29.9 billion from the services sectors.

Table 13: Industrial Composition of Final Expenditure in terms of Value-Added at Basic Values, 2005

Industrial Sector	Private consumption expenditure	Government consumption expenditure	Gross capital formation	Exports	Million Dollars
Agriculture	38.7	1.1	0.3	70.7	
Manufacturing (Non-Oil)	1,625.0	321.5	1,271.6	45,460.1	
Manufacturing (Oil)	98.2	3.0	2.7	4,681.8	
Utilities	994.0	184.7	106.8	1,560.0	
Construction	189.5	135.0	5,412.7	538.1	
Wholesale & Retail Trade	4,636.7	700.0	2,392.8	26,690.2	
Hotels & Restaurants	3,320.9	89.9	92.5	705.9	
Transport & Storage	2,831.4	272.7	583.7	16,562.3	
Information & Communications	1,720.9	392.9	858.0	5,156.5	
Financial Services	4,951.2	649.4	724.3	14,328.0	
Business Services	5,331.8	1,426.5	2,727.2	13,367.3	
Other Services	11,715.9	11,723.4	297.1	2,322.7	
TOTAL	37,454.2	15,899.9	14,469.8	131,443.6	

Note: Figures may not add up to the total due to rounding.

CHAPTER 5: CONCLUSION

5.1 Similar to the earlier I-O tables, the 2005 I-O tables have been used to derive and reconcile the three GDP estimates in the rebasing of Singapore's National Accounts to reference year 2005. I-O tables also provide a comprehensive and integrated framework for checking the consistency of statistics obtained from different sources. Conceptual changes and methodological improvements implemented in the 2005 I-O tables include the measurement of the implicit charges for FISIM, and refinement on implicit service charges associated with the transaction of debt securities.

5.2 In 2005, the Singapore economy produced \$563.3 billion worth of goods and services and consumed \$161.3 billion worth of intermediate inputs. Imports of goods and services totalled \$237.5 billion, of which \$202.4 billion were purchased by industrial sectors as inputs for production, with only \$35.1 billion retained for final demand. Exports of goods and services accounted for \$298.9 billion or 53 per cent of total domestic output in 2005, reflecting Singapore's high dependency on external demand. GVA amounted to \$199.3 billion with the non-oil manufacturing sector contributing \$48.7 billion or 24 per cent of total GVA.

5.3 I-O tables embody a wealth of information which enable policy formulation and evaluation, economic analysis and forecasting. The tables can also be applied to assess the impact of changes in final demand on the economy, examine linkages to identify key sectors of the economy and analyse structural changes. The applications presented within demonstrate the powerful analytical capability of the I-O tables.

5.4 Multiplier analysis showed that the construction sector had the highest simple output multiplier while the financial services sector had the highest simple VA multiplier in 2005. Although non-oil manufacturing had the highest output and VA in nominal terms, its VA multiplier was one of the lowest due to its high import content. The hotels and restaurants sector had one of the highest simple employment multipliers while the other services sector had the highest simple income multiplier.

5.5 In terms of total multipliers, industrial sectors such as the hotels and restaurants sector, which were both labour intensive and where a significant proportion of their goods and services were consumed by households, exhibited higher income, VA and output total multipliers vis-à-vis simple multipliers. Conversely, industrial sectors which were neither labour intensive nor PCE oriented, such as oil manufacturing, only registered marginally higher total multipliers vis-à-vis simple multipliers.

5.6 From the linkage analysis, the information and communications and utilities sectors had the highest forward linkages with the lowest coefficients of variation as they were essential services to all other sectors in the economy. The oil manufacturing sector had the lowest forward linkage with the highest coefficient of variation indicating that it supplied a smaller proportion of its output as intermediate inputs to the domestic economy.

5.7 While the non-oil manufacturing sector contributed to almost half of the net foreign exchange earnings in Singapore, its VA per unit of export was relatively lower as compared to the services sector due to its higher import requirements for exports. Thus, the promotion of merchandise exports would generate lower VA per unit of export vis-à-vis services exports.

5.8 The complete set of the 2005 benchmark I-O tables at the detailed industry and commodity levels can be downloaded from the DOS website (www.singstat.gov.sg).

DETAILED TABLES

TABLE 1 COMMODITY ANALYSIS OF DOMESTIC OUTPUT, 2005

SALES BY INDUSTRY	SALES BY COMMODITY		Nursery products	Other agriculture	Livestock	Aquarium fish	Other fisheries	Food preparations	Bread, biscuits & confectionery	Sugar, chocolate & related products

84 Retail trade of computer products	88.6	41.2
85 Retail trade of other products	87.9	83.5
86 Food & beverage services	96.6	86.3
87 Accommodation services	58.1	99.6
88 Passenger transport by land	98.0	99.9
89 Water transport	98.0	99.7
90 Supporting services to water transport	93.2	98.6
91 Port operation services	92.3	98.6
92 Air transport	98.5	100.0
93 Supporting services to air transport	95.8	100.0
94 Airport operation services	68.0	99.4
95 Freight transport by land	88.2	76.2
96 Logistics service providers & courier	87.9	77.6
97 Other transport services	90.5	80.1
98 Warehousing services	85.9	70.6
99 Sight-seeing & tourism	99.4	99.2
100 Communications	90.5	99.6
101 Life insurance	94.2	100.0
102 General & other insurance	95.4	97.9
103 Banks & finance companies	94.7	99.6
104 Other financial services	93.1	95.2
105 Fund management	99.1	78.6
106 Real estate	96.6	85.1
107 Legal services	99.3	98.9
108 Accounting & secretarial services	97.3	95.5
109 Information technology	87.2	89.8
110 Publishing	90.2	100.0
111 Architectural & engineering services	96.4	93.8
112 Industrial design services	97.1	100.0
113 Petroleum & mining consultants	93.1	100.0
114 Employment & labour contracting	99.7	95.3
115 Advertising	98.7	81.7
116 Exhibitions	86.2	100.0
117 Leasing of machinery & equipment	92.2	59.6
118 Management consultants	91.7	91.5
119 Hotel management services	99.4	100.0
120 Research & development	81.7	86.6

TABLE 23 ANALYSIS OF OUTPUT OF PRINCIPAL PRODUCTS, 2005

	Output of principal products of each industry per hundred units of industry output	Output of principal products per hundred units of commodity output
121 Business representative offices & HQ activities	99.2	100.0
122 Other business & technical services	97.0	51.7
123 Producers of government services	100.0	100.0
124 Security services	93.4	78.6
125 Education	96.5	97.1
126 Medical & health services	87.7	97.7
127 Environmental health services	92.2	77.3
128 Media entertainment	94.8	100.0
129 Museums, parks & performing arts	92.3	100.0
130 Sports & recreation	90.6	97.4
131 Personal & household services	97.0	95.8
132 Repairs of household goods	98.2	57.1
133 Repairs of road transport equipment	91.2	64.3
134 Domestic services	100.0	100.0
135 Non-profit bodies	100.0	100.0
136 Ownership of dwellings	100.0	100.0

APPENDICES

Appendix 1

Classification of Industry / Commodity

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
001 Nursery products	01141, 01142, 01149 (Part)	292 (Part)
002 Other agriculture	0111x, 01120, 01130, 01149(Part), 01190, 01300(Part), 0140x, 02000	041, 042, 043, 044, 045, 054(Part), 057(Part), 061(Part), 072(Part), 075(Part), 121, 222, 223(Part), 261, 263, 264, 265, 268(Part), 291(Part), 292(Part)
003 Livestock	0121x, 0122x, 0123x, 01300(Part)	001, 012(Part), 025
004 Aquarium fish	03203	034 (Part)
005 Other fisheries	0310x, 03201, 03202, 03204, 03205, 03209, 0330x	034(Part), 036(Part), 291(Part)
006 Food preparations	1511x, 1512x, 1513x	011, 012 (Part), 016, 017(Part), 035, 036(Part), 037, 054(Part), 056(Part), 057(Part), 058(Part), 059, 062(Part), 091(Part), 211(Part), 212, 291(Part), 292(Part), 411(Part), 431(Part)
007 Bread, biscuits and Confectionery	1541x	048(Part)
008 Sugar, Chocolate & related products	15322, 1542x, 1543x	061(Part), 062(Part), 072(Part), 073
009 Oils & fats	1514x	091(part), 411(Part), 421, 422, 431(Part)
010 Dairy products	1520x	022(Part), 023, 024
011 Coffee & tea	15451, 15452, 15453, 15454	071, 074
012 Other food products	1531x, 15321, 15329, 15330, 15440, 15455, 1549x	017(Part), 022(Part), 046, 047, 048(Part), 056(Part), 058(Part), 072(Part), 075(Part), 081(Part), 098(Part), 223(Part), 287(Part), 292(Part), 592(Part)

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
013 Soft drinks	1604x	098(Part), 111, 112(Part)
014 Alcoholic drinks and tobacco products	16010, 16020, 16030, 1700x	112(Part), 122
015 Yarn, fabrics & textile articles	1810x, 1821x, 18220, 18230, 18290, 19301	266(Part), 267(Part), 268(Part), 651(Part), 652, 653, 654, 655, 656, 657(Part), 658(Part), 659, 775(Part), 821(Part), 899(Part)
016 Wearing apparel	1910x, 19302, 19303, 19309	269, 841(Part), 842(Part), 843(Part), 844(Part), 845(Part), 846(Part), 848(Part)
017 Footwear, leather & fur products	1920x, 20110, 2012x, 2020x	211(Part), 611, 612, 613, 658(Part), 831, 841(Part), 842(Part), 843(Part), 844(Part), 845(Part), 846(part), 848(Part) 851
018 Wood and wooden products (except furniture)	2110x, 2121x, 2122x, 2123x, 2129x, 36105, 36996(Part), 36997(Part)	244, 245, 246, 247, 248, 292(Part), 633, 634(Part), 635, 899(Part)
019 Paper and paper products	22010, 2202x, 2209x, 36997(Part)	251, 634(Part), , 641, 642(Part), 684(Part)
020 Newspapers, books and magazines	23111, 23112	892(Part)
021 Other printing	23113, 23114, 23115, 23119, 2312x	642(Part), 892(Part), 894(Part)
022 Petroleum and petroleum products	10001, 24100, 2420x	333, 334(Part), 335(Part),
023 Industrial chemicals and gases	2521x, 25269	274(Part), 285(Part), 325(Part), 411(Part), 431(Part), 511(Part), 512(Part), 513(Part), 514(Part), 515(Part), 516(Part), 522(Part), 523, 524

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
024 Petrochemicals	2510x	335(Part), 511(Part), 512(Part), 513(Part), 516(Part), 571, 572, 573 574, 575, 579
025 Pharmaceutical products	2600x	061(Part), 514(Part), 515(Part), 516(Part), 541, 542, 598(Part)
026 Perfumes, cosmetics & toiletries	25242, 25243	512(Part), 551(Part), 553(Part)
027 Cleaning and polishing preparations	25241, 25244	554, 591(Part), 598(Part)
028 Paints	2523x	533(Part), 598(Part)
029 Food chemicals and additives	25261	514(Part), 516(Part), 551(Part)
030 Other chemical products	2522x, 25250, 25262, 25263, 2529x, 36992	081(Part), 266(Part), 267(Part), 272, 431(Part), 522(Part), 525, 531, 532, 533(Part), 553(Part), 562, 591(Part), 592(Part), 593, 597, 598(Part), 651(Part), 882, 895(Part), 899(Part)
031 Rubber and rubber products	2711x, 2712x, 2719x	231, 232, 292(Part), 621, 625, 629, 657(Part)
032 Plastic precision products	27216	
033 Other plastic products	27211, 27212, 27213, 27214, 27215, 27217, 27218, 27219, 27220, 36996(Part), 36997(Part)	581, 582, 583, 893
034 Glass and glass products	28100	664(Part), 665
035 Fibreglass and fibreglass products	28992	651(Part), 664(Part)
036 Bricks, cement & concrete products	10002, 1110x, 11900, 2892x, 28930, 2894x, 28950	273, 274(Part), 281, 283, 284, 285(Part), 286, 287(Part), 289(Part), 321, 322, 325(Part), 661(Part), 662, 663(Part)

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
037 Non-metallic mineral products	2891x, 28991, 28993, 28994, 28995, 28999	277, 278(Part), 661(Part), 663(Part), 666, 812(Part)
038 Basic metals	2910x, 2920x, 2930x	278(Part), 287(Part), 288, 289(Part), 671, 672, 673, 674, 675, 676(Part), 681, 682(Part), 683(Part), 684(Part), 685(Part), 686(Part), 687(Part), 689, 699(Part), 971(Part)
039 Structural metal products	3011x, 30131	676(Part), 677, 679(Part), 682(Part), 683(Part), 684(Part), 685(Part), 686(Part), 687(Part), 691, 699(Part), 811
040 Metal stampings	30911, 30912, 30913, 30914, 30915	686(Part), 699(Part), 961, 971(Part)
041 Metal precision components	30993, 30995, 30997	
042 Non-insulated cable products	3094x	678, 682(Part), 693, 699(Part)
043 Metal containers	30120, 3095x	692
044 Treatment and coating of metals	3092x	
045 Other metal products	30139, 30919, 3093x, 30991, 30992, 30994, 30996, 30998, 30999, 31122, 31129(Part), 31131, 31260, 36912, 36996(Part), 36997(Part)	679(Part), 682(Part), 684(Part), 694, 695(Part), 696, 697(Part), 699(Part), 746, 747, 748(Part), 749(Part), 775(Part), 812(Part), 891(Part), 894(Part), 895(Part), 899(Part)
046 Computers and computer peripheral equipment	33411, 33415, 33416, 33419	751(Part), 752(Part), 759(Part), 764(Part)
047 Data storage	33412, 33413, 33414, 33417	752(Part), 898(Part)
048 Audio and video equipment	3330x	761, 762, 763, 764(Part)

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
049 Semiconductors	3311x	776(Part)
050 Electron tubes and electronic display devices	33191, 33198	776(Part)
051 Printed circuit boards	33194, 33195, 33196	759(Part), 764(Part) 772(Part)
052 Communication equipment	3320x, 33904	764(Part), 778(Part)
053 Other electronic products	33192, 33193, 33197, 33199, 3349x, 33901, 33902, 33903, 33909	751(Part), 759(Part), 771(Part), 772(Part), 776(Part), 778(Part)
054 Lifting and hoisting machinery	3114x	744(Part)
055 Other industrial machinery and equipment	31110, 31121, 31129(Part), 31132, 31192, 31193, 31199, 31210, 3122x, 31233, 3124x, 31250, 3127x, 31291, 31293, 31294, 31295, 31299	695(Part), 699(Part), 711, 712, 713(Part), 714(Part), 718, 721, 722, 723(Part), 724, 725, 726, 727, 728, 731, 733, 735, 737, 741(Part), 742, 743(Part), 744(Part), 745(Part), 748(Part), 749(Part), 759(Part), 778(Part), 791(Part), 812(Part)
056 Refrigerators and air-conditioners	31191	741(Part), 743(Part), 775(Part)
057 Oil rigs and oilfield machinery	31231, 31232, 31239	695(Part), 723(Part), 793(Part)
058 General engineering works	31292	
059 Electrical industrial apparatus	3210x, 3220x, 32305, 32900	716, 771(Part), 772(Part), 773(Part), 775(Part) 778(Part)
060 Recorded Media	23200, 36991	898(Part)
061 Household appliances	3260x	697(Part), 743(Part), 775(Part)
062 Storage and primary batteries	3240x	778(Part)
063 Electrical wires and cables	32301, 32302, 32303, 32304, 32309	773(Part)

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
064 Lamp and lighting fixtures	32500, 36997(Part)	771(Part), 778(Part), 813
065 Land transport equipment	3510x, 35300, 3590x	713(Part), 781, 782, 783, 784, 785, 786, 791(Part), 891(Part)
066 Building of ships and boats	35201, 35203(Part)	793(Part)
067 Repairing of ships and boats	35202, 35203(Part)	
068 Marine engine and ship parts	35204	713(Part), 749(Part)
069 Aircraft	3540x	713(Part), 714(Part), 792, 899(Part)
070 Medical instruments	34111, 34112, 34113, 34114, 34119	774, 872(Part), 899(Part)
071 Scientific instruments (including watches & clocks)	3412x, 34130, 3430x	745(Part), 873, 874, 885
072 Photographic and optical goods	34115, 3420x	871, 881, 883, 884
073 Furniture (except of stone)	36101, 36102, 36103, 36104, 36106, 36109	821(Part), 872(Part)
074 Jewellery	36911, 36919, 36998	667, 897
075 Other Manufacturing	31300, 36920, 36930, 3694x, 36993, 36994, 36995, 36999	697(Part), 751(Part), 894(Part), 894(Part), 895(Part), 896, 898(Part), 899(Part)
076 Scrap	35205, 4300x	282, 291(Part), 334(Part), 793(Part)
077 Electricity	4010x	351
078 Gas	4020x	342, 343, 345
079 Water	41000	

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
080 Building construction	4521x, 45230, 45242(Part), 45243, 45244(Part), 45249(Part) 45291, 45292, 45301, 45302(Part), 45303, 45304, 45305, 45306, 45307, 45308(Part), 45309, 45401(Part), 45402(Part), 45403(Part), 45404(Part), 45405(Part), 45406(Part), 45409(Part)	
081 Other construction	4510x, 4522x, 45241, 45242(Part), 45244(Part), 45249(Part), 45299, 45302(Part) 45308(Part) , 45401(Part), 45402(Part), 45403(Part), 45404(Part), 45405(Part), 45406(Part), 45409(Part), 45500	
082 Wholesale trade of computer products	50523, 50524, 50525	
083 Wholesale trade of other products	50100, 5021x, 5022x, 5029x, 5031x, 5032x, 5033x, 5034x, 5035x, 5036x, 5037x, 5039x, 5041x, 5042x, 5043x, 5049x, 5051x, 50521, 50522, 5059x, 5061x, 5062x, 5091x, 50920, 5093x, 5099x	
084 Retail trade of computer products	51473, 51474	
085 Retail trade of other products	5110x, 5120x, 5131x, 5132x, 5141x, 5142x, 5143x, 5144x, 5145x, 5146x, 51471, 51472, 5148x, 5149x, 51500, 5160x	
086 Food & beverage services	5821x, 5822x, 58230, 58240, 58250, 58290	
087 Accommodation services	5811x, 5812x	
088 Passenger transport by land	5210x, 52211, 52212, 52213(Part), 52214, 52215, 52219	
089 Water transport	53101, 53109, 53201, 53202(Part), 53209, 55396	
090 Supporting services to water transport	53102, 55310, 5532x, 55391, 55392, 55395, 55397, 55399, 55523	

Industry/Commodity Classification	Singapore Standard Industrial Classification, 2005	Standard International Trade Classification, Rev.3 (SITC Rev.3)
091 Port operation services	55393, 55394	
092 Air transport	54001, 54009	
093 Supporting services to air transport	54002, 54003, 55401, 55402, 55405, 55409	
094 Airport operation services	55403, 55404	
095 Freight transport by land	5223x, 52300, 55209	
096 Logistics service providers & courier services	55104, 55521, 56020	
097 Other transport services	55511(Part), 55519(Part), 55522, 55524, 55529, 55901, 55909(Part)	
098 Warehousing services	55101, 55102, 55103, 55109	
099 Sight-seeing & tourism	52220, 53103, 53202(Part), 53203, 7821x, 78290(Part)	
100 Communications	56010, 6201x, 6202x, 62090, 63131	
101 Life insurance	66101, 66103(Part), 66201, 66203(Part)	
102 General and other insurance	66102, 66103(Part), 66104, 66202, 66203(Part), 66300, 66400, 6690x	
103 Banks & finance companies	6512x, 6513x, 6514x, 65150, 65929, 65991

ANNEX

TECHNICAL DISCUSSION

1 This Annex presents a technical discussion of how the following were derived: (i) the symmetric tables; (ii) the open and closed models; (iii) the applications used (multipliers, linkage analysis and derivation of net foreign exchange earnings); and (iv) the RAS method. It requires some familiarity with matrix algebra.

I. Derivation of Symmetric Tables

2 This section explains the methods to derive symmetrical Input-Output (I-O) tables from the use of Basic Table 2: Commodity Analysis of Purchases from Domestic Production based on the various technology assumptions. These assumptions are the industry technology assumption, commodity technology assumption and hybrid technology assumption. Symmetrical tables can either be *commodity-by-commodity* or *industry-by-industry*.

Notation

3 The following lists the various notations used in the section. Other notations necessary for clarity are explained within. In general, vectors are in bold lower cases, and matrices are in bold upper cases, except in the case of diagonalisation.

M⁻¹ Inverse of a matrix.

v' **M'** Transpose of a vector or a matrix.

̂v **⟨v⟩** Diagonalisation of a vector.

M Make matrix showing the outputs of commodities produced by industries; we use the notation $\mathbf{M} = \{m_{ij}\}$, where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. A typical element m_{ij} is the amount of commodity j produced by industry i .

U Absorption matrix showing the purchases of domestically produced commodities by industries; $\mathbf{U}=\{u_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. A typical element u_{ij} is the amount of domestically produced commodity i purchased by industry j .

f ($n \times 1$) vector of final demand for output of commodities.

g ($n \times 1$) vector of industrial output.

q ($n \times 1$) vector of commodity output.

y ($1 \times n$) vector of primary inputs purchased by industries.

H Intermediate transactions part of the absorption matrix in coefficient form; $\mathbf{H}=\{h_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. Each entry of the matrix \mathbf{U} is divided by the relevant industry output, i.e. $\mathbf{H} = \mathbf{U}\hat{\mathbf{g}}^{-1}$. Consequently, a typical element

h_{ij} is the requirements of commodity i per unit of output of industry j .

- C Product mix matrix; $\mathbf{C} = \{c_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. Each element c_{ij} is defined as the proportion of commodity i produced by industry j per unit level of industry j output, i.e. $\mathbf{C} = \mathbf{M}\hat{\mathbf{g}}^{-1}$.
- D Market share matrix; $\mathbf{D} = \{d_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. Each element d_{ij} is defined as the proportion of commodity j output produced by industry i per unit of commodity j output, i.e. $\mathbf{D} = \mathbf{M}\hat{\mathbf{q}}^{-1}$.
- B Commodity-by-commodity coefficient matrix; $\mathbf{B} = \{b_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. Each element b_{ij} specifies the amount of commodity i used in the production of one unit of commodity j . Hence each column of \mathbf{B} describes the commodity inputs for a unit level of activity of the commodity production account to which the column refers. Consequently, the vector of commodity outputs entering intermediate demand is $\mathbf{B}\mathbf{q}$ and as the commodities entering final demand are \mathbf{f} , then \mathbf{q} must satisfy $\mathbf{q} = \mathbf{B}\mathbf{q} + \mathbf{f}$.
- A Industry-by-industry coefficient matrix; $\mathbf{A} = \{a_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. A typical element a_{ij} specifies the purchases of industry i 's output used in the production of one unit of output by industry j . \mathbf{A} satisfies the relationship similar to \mathbf{B} , by showing how a vector of industry output, \mathbf{g} , satisfies intermediate and final demand for industry output. This takes the form that total industry output \mathbf{g} equals industry output for intermediate demand \mathbf{Ag} plus industry output entering final demand. \mathbf{g} must satisfy $\mathbf{g} = \mathbf{Ag} + \mathbf{Df}$.
- e $(n \times 1)$ vector of 1's.

Exhibit 6: Schematic Representation of Income, Expenditure, Commodity and Industry Accounts

Sellers	Buyers	Industries	Commodities	Final Demand	Total
Industries			\mathbf{M}		\mathbf{g}
Commodities		\mathbf{U}		\mathbf{f}	\mathbf{q}
Primary Inputs			\mathbf{y}'		
Total		\mathbf{g}'	\mathbf{q}'		

4 In Exhibit 6, the entries in each row show the sales from the account given by the row to the account specified by the column in which the entry is situated.

5 The first row shows the sales from the industry account to the commodity account which is given in detail by \mathbf{M} ; the row totals of this matrix give the industry outputs \mathbf{g} . The column totals of \mathbf{M} give the total amounts purchased by the commodity accounts – commodity outputs \mathbf{q}' .

6 The second row shows which accounts these supplies of commodities are sold; to industries (the intermediate transactions matrix, \mathbf{U} , which is part of the absorption matrix) and the final demand account as vector \mathbf{f} . Industry inputs are completed by the purchases of primary inputs vector \mathbf{y}' .

7 From the above definitions and schematic representation of the National Accounts system, the following relationships may be assembled:

$$\mathbf{q} = \mathbf{Ue} + \mathbf{f} \quad (1.1)$$

$$\mathbf{q} = \mathbf{M}'\mathbf{e} \quad (1.2)$$

$$\mathbf{g} = \mathbf{Me} \quad (1.3)$$

8 By arranging previous equations, matrices \mathbf{H} , \mathbf{C} and \mathbf{D} satisfy the equations:

$$\mathbf{U} = \mathbf{H}\hat{\mathbf{g}} \quad (1.4)$$

$$\mathbf{M}' = \mathbf{C}\hat{\mathbf{g}} \quad (1.5)$$

$$\mathbf{M} = \mathbf{D}\hat{\mathbf{q}} \quad (1.6)$$

9 From equation (1.4), $\mathbf{Ue} = \mathbf{Hg}$ and substituting this into (1.1), we get:

$$\mathbf{q} = \mathbf{Hg} + \mathbf{f} \quad (1.7)$$

10 This equation is a formal description of that part of the absorption matrix describing the allocation of domestic output. In other words, domestic commodity supplied in an economy is the sum of its intermediate uses by industries and final exogenous demand.

A. Commodity Technology Assumption

11 In order to derive symmetrical *commodity-by-commodity* or *industry-by-industry* I-O tables, we require a *commodity-by-commodity* coefficient matrix, \mathbf{B} and an *industry-by-industry* coefficient matrix, \mathbf{A} .

12 Each element b_{ij} of the matrix \mathbf{B} specifies the amount of commodity i used in the production of one unit of commodity j , while each element a_{ij} in \mathbf{A} specifies the purchases of industry's i output used in the production of one unit of output by industry j . Despite matrices \mathbf{B} and \mathbf{A} being unobserved, we can utilise known matrices \mathbf{H} and \mathbf{M} to solve for \mathbf{B} and \mathbf{A} under certain assumptions.

13 Equation (1.7) is the key to this task and it implies a functional relationship is assumed between commodity and industry outputs. One way to achieve substitution for \mathbf{g} in terms of \mathbf{q} is to make use of equations (1.2) and (1.5). Thus:

$$\mathbf{M}'\mathbf{e} = \mathbf{C}\hat{\mathbf{g}}$$

but $\mathbf{M}'\mathbf{e} = \mathbf{q}$
so that $\mathbf{g} = \mathbf{C}^{-1}\mathbf{q}$.

14 Substituting this expression for \mathbf{g} into (1.7), then:

$$\mathbf{q} = \mathbf{HC}^{-1}\mathbf{q} + \mathbf{f} \quad (1.8)$$

15 However, as the definition of \mathbf{B} requires that $\mathbf{q} = \mathbf{Bq} + \mathbf{f}$, then one solution for \mathbf{B} in terms of known matrices is:

$$\mathbf{B} = \mathbf{HC}^{-1} \quad (1.9)$$

16 Matrix \mathbf{B} is the *commodity-by-commodity* coefficient matrix on the basis of the commodity technology assumption, the assumption being introduced via the equation $\mathbf{M}' = \mathbf{C}\hat{\mathbf{g}}$ which specifies the structure of commodity output as being determined by a fixed range of commodities produced per unit of industrial output. Equation (1.9) if expressed as $\mathbf{H} = \mathbf{BC}$ also shows that commodities under the commodity technology assumption have the same input structure in whichever industry they are made.

17 Equation (1.5) also leads to the *industry-by-industry* matrix on the basis of the commodity technology assumption by substituting $\mathbf{q} = \mathbf{Cg}$ into (1.7). Re-arranging, we get:

$$\mathbf{g} = \mathbf{C}^{-1}\mathbf{Hg} + \mathbf{C}^{-1}\mathbf{f} \quad (1.10)$$

18 As the definition of \mathbf{A} requires that $\mathbf{g} = \mathbf{Ag} + \mathbf{C}^{-1}\mathbf{f}$ then a solution for \mathbf{A} is:

$$\mathbf{A} = \mathbf{C}^{-1}\mathbf{H} \quad (1.11)$$

19 Equation (1.11) defines the *industry-by-industry* matrix on the basis of the commodity technology assumption.

B. Industry Technology Assumption

20 From equations (1.3) and (1.6), we see that $\mathbf{Me} = \mathbf{D}\hat{\mathbf{q}}\mathbf{e}$. As $\mathbf{Me} = \mathbf{g}$, then $\mathbf{g} = \mathbf{Dq}$. The substitution of this alternative specification of the structure of output into equation (1.7) realises \mathbf{B} and \mathbf{A} under an industry technology assumption. Thus:

$$\mathbf{q} = \mathbf{HDq} + \mathbf{f} \quad (1.12)$$

so that the solution to the equation $\mathbf{q} = \mathbf{Bq} + \mathbf{f}$ under the industry technology assumption is:

$$\mathbf{B} = \mathbf{HD} \quad (1.13)$$

21 $\mathbf{B} = \mathbf{HD}$ is the *commodity-by-commodity* coefficient matrix on an industry technology assumption. It portrays a structure of production where each industry produces a range of

commodities with the same input mix. Recalling that $\mathbf{g} = \mathbf{D}\mathbf{q}$ and replacing $\mathbf{q} = \mathbf{D}^{-1}\mathbf{g}$ into $\mathbf{q} = \mathbf{H}\mathbf{D}\mathbf{q} + \mathbf{f}$, we get $\mathbf{g} = \mathbf{D}\mathbf{H}\mathbf{g} + \mathbf{D}\mathbf{f}$.

22 From the above, it is clear that:

$$\mathbf{A} = \mathbf{DH} \quad (1.14)$$

23 $\mathbf{A} = \mathbf{DH}$ is the industry by industry coefficient matrix on an industry technology assumption.

C. Hybrid Technology Assumption

24 The commodity and industry technology assumptions are two extremes, and it is more likely that in real life industries are more likely to satisfy a hybrid technology assumption which is a blend of them. The hybrid system divides the make matrix, \mathbf{M} , into two parts; \mathbf{M}_1 which gives the commodities produced by a commodity technology and \mathbf{M}_2 which gives those commodities produced by an industry technology. Consequently,

$$\mathbf{M} = \mathbf{M}_1 + \mathbf{M}_2 \quad (1.15)$$

25 Similarly for commodity and industry outputs respectively:

$$\mathbf{q} = \mathbf{q}_1 + \mathbf{q}_2 \quad (1.16)$$

$$\mathbf{g} = \mathbf{g}_1 + \mathbf{g}_2 \quad (1.17)$$

26 Introducing a specific commodity technology structure \mathbf{g}_1 ,

$$\mathbf{g}_1 = \mathbf{M}_1 \mathbf{e} = \mathbf{C}_1^{-1} \mathbf{q}_1 \quad (1.18)$$

so that each unit of industry output produced according to the commodity technology assumption has a fixed commodity mix. The above equation covers subsidiary production in an industry; that is, production not linked to its main production process.

27 Under an industry technology assumption, commodities produced may be assumed to be the by-products of a main industrial process and thus have the following output structures.

$$\mathbf{M}_2 = \mathbf{D}_2 \hat{\mathbf{q}} \quad (1.19)$$

28 The assumption underlying this equation is that the range of by-products produced according to an industry technology are assumed to have a total market share that is a constant proportion of total commodity output. Since $\mathbf{g}_2 = \mathbf{M}_2 \mathbf{e}$, it follows from (1.19) that:

$$\mathbf{g}_2 = \mathbf{D}_2 \mathbf{q} \quad (1.20)$$

29 Substituting for \mathbf{g}_1 and \mathbf{g}_2 into (1.17), we get:

$$\mathbf{g} = \mathbf{C}_1^{-1} \mathbf{q}_1 + \mathbf{D}_2 \mathbf{q} \quad (1.21)$$

30 Since $\mathbf{M}_2 = \mathbf{D}_2 \hat{\mathbf{q}}$, it follows that $\mathbf{M}'_2 = \hat{\mathbf{q}} \mathbf{D}'_2$, and since $\mathbf{q}_2 = \mathbf{M}'_2 \mathbf{e} = \hat{\mathbf{q}} \mathbf{D}'_2 \mathbf{e}$

$$\mathbf{q}_2 = \langle \mathbf{D}'_2 \mathbf{e} \rangle \mathbf{q} \quad (1.22)$$

31 From equation (1.16), $\mathbf{q}_1 = \mathbf{q} - \mathbf{q}_2$ and substituting for \mathbf{q}_2 from equation (1.22), equation (1.21) becomes: $\mathbf{g} = \mathbf{C}_1^{-1} [\mathbf{q} - \langle \mathbf{D}'_2 \mathbf{e} \rangle \mathbf{q}] + \mathbf{D}_2 \mathbf{q}$ where:

$$\mathbf{R} = \mathbf{C}_1^{-1} [\mathbf{I} - \langle \mathbf{D}'_2 \mathbf{e} \rangle] + \mathbf{D}_2 \quad (1.23)$$

then:

$$\mathbf{g} = \mathbf{R} \mathbf{q} \quad (1.24)$$

32 $\mathbf{g} = \mathbf{R} \mathbf{q}$ is the relationship linking commodity output to industry output. Recalling equation (1.7), $\mathbf{q} = \mathbf{H} \mathbf{g} + \mathbf{f}$, and then replacing equation (1.24) into (1.7), we get:

$$\mathbf{q} = \mathbf{H} \mathbf{R} \mathbf{q} + \mathbf{f} \quad (1.25)$$

33 The matrix $\mathbf{H} \mathbf{R}$ is the commodity by commodity matrix \mathbf{B} calculated under a hybrid technology assumption called henceforth \mathbf{B}_{HYB} . Thus $\mathbf{B}_{\text{HYB}} = \mathbf{H} \mathbf{R}$ and so:

$$\mathbf{q} = \mathbf{B}_{\text{HYB}} \mathbf{q} + \mathbf{f} \quad (1.26)$$

34 An analogous treatment is available for industry output and for the industry by industry matrix \mathbf{A} . Rearranging equation (1.24), we get $\mathbf{q} = \mathbf{R}^{-1} \mathbf{g}$ and substituting for \mathbf{q} into equation (1.25):

$$\mathbf{g} = \mathbf{R} \mathbf{H} \mathbf{g} + \mathbf{R} \mathbf{f} \quad (1.27)$$

35 Thus the industry by industry matrix \mathbf{A} , based on a hybrid technology assumption is $\mathbf{A}_{\text{HYB}} = \mathbf{R} \mathbf{H}$. Thus:

$$\mathbf{g} = \mathbf{A}_{\text{HYB}} \mathbf{g} + \mathbf{R} \mathbf{f} \quad (1.28)$$

II. Derivation of Open and Closed Models

36 This section explains the methodology used to construct the static open and closed I-O models from symmetric tables. In the symmetric tables, total sales equal total purchases for each sector. Both the open and closed I-O models can be used to derive various multipliers and net foreign exchange earnings. The derivation of inter-industry linkages and their associated coefficients of variation are also discussed.

37 The following lists the various notations used in this section. Other notations, where necessary for clarity, are explained within their respective within.

Notation

\mathbf{A}^{-1}	Inverse of a matrix.
$\mathbf{v}' \quad \mathbf{A}'$	Transpose of a matrix or vector.
$\hat{\mathbf{v}} \quad \langle \mathbf{v} \rangle$	Diagonalisation of a vector.
\mathbf{x}	($n \times 1$) vector of total sales (or output) by industry. $\mathbf{x} = \{x_i\}$ where $i=1,2,\dots,n$. \mathbf{x} is also equal to the vector of total purchases (or inputs) by sector.
\mathbf{Z}	Matrix of sales of intermediate goods by sector i to sector j ; $\mathbf{Z}=\{z_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. A typical element z_{ij} is the amount of industry output produced by sector i and purchased by industry j .
\mathbf{A}	Matrix of intermediate transactions part of the absorption matrix in coefficient form; $\mathbf{A}=\{a_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$. Each entry of the matrix \mathbf{A} is divided by the relevant industry output. Consequently, a typical element a_{ij} is the requirements of sector i per unit of output of sector j , or $a_{ij} = z_{ij} / x_j$.
\mathbf{f}	($n \times 1$) vector of output sold by sector i for final demand. Each j^{th} element represents the portion of sector i 's output purchased by final demand.
$\tilde{\mathbf{f}}$	($n \times 1$) vector of output sold by sector i for final demand excluding private consumption expenditure.
\mathbf{c}	($n \times 1$) vector of consumption of goods and services produced by sector i . Each j^{th} element represents the consumption of sector i 's output by households.
\mathbf{w}	($1 \times n$) vector of wages paid out by sector j .
\mathbf{y}	($1 \times n$) vector of primary inputs (value-added) purchased by sector j .
\mathbf{m}	($1 \times n$) vector of imports purchased by sector j .

- p** $(1 \times n)$ vector of primary inputs, including imports, purchased by sector j .
- Θ** Leontief inverse or total requirements coefficient matrix. $\Theta = \{\theta_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$.
- Ψ** Closed inverse excluding consumption multiplier and household multiplier. $\Psi = \{\psi_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$.
- e** $(n \times 1)$ vector of 1's

38 For the purpose of this exposition, the formulae are illustrated for an economy with n sectors using *industry-by-industry* symmetric tables.

A. Open Model

39 In the open model, all final demand variables, namely, private consumption expenditure (PCE), government consumption expenditure (GCE), gross capital formation (GCF), and exports of goods and services are assumed to be exogenous.

40 From the above notation, a system of equations linking total output with intermediate and final demand is

$$\begin{aligned} x_1 &= z_{11} + z_{12} + \dots + z_{1n} + f_1 \\ x_2 &= z_{21} + z_{22} + \dots + z_{2n} + f_2 \\ &\dots \\ x_n &= z_{n1} + z_{n2} + \dots + z_{nn} + f_n \end{aligned} \tag{2.1}$$

41 The first row in Equation (2.1) represents the distribution of sector 1's output. The z terms represent the inter-industry flows of input and output. This shows the link between total sales with final demand for each sector. Replacing $z_{ij} / x_j = a_{ij}$ into the equations above, the system of equations (2.1) can be expressed as:

$$\begin{aligned} x_1 &= a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n + f_1 \\ x_2 &= a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n + f_2 \\ &\dots \\ x_n &= a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n + f_n \end{aligned} \tag{2.2}$$

42 As specified in Chapter 2, a fundamental assumption in input-output analysis is that the technical coefficients, a_{ij} , are assumed to be fixed, i.e. inputs are used in fixed proportions.

43 For given values of f_1 , to f_n , the set of equations (2.2) are essentially n equations in n unknowns, namely, x_1 , to x_n . Dependency and multiplier analyses based on changes in final demand can be obtained if the x_i are expressed in terms of final demand for each sector's gross output. Solving the system of equations gives:

$$\begin{aligned}
x_1 &= \theta_{11}f_1 + \theta_{12}f_2 + \dots + \theta_{1n}f_n \\
x_2 &= \theta_{21}f_1 + \theta_{22}f_2 + \dots + \theta_{2n}f_n \\
&\dots \\
x_n &= \theta_{n1}f_1 + \theta_{n2}f_2 + \dots + \theta_{nn}f_n
\end{aligned} \tag{2.3}$$

44 In matrix notation, equations (2.2) can be expressed as:

$$\mathbf{x} = \mathbf{Ax} + \mathbf{f} \tag{2.4}$$

where:

$$\mathbf{x} = \begin{bmatrix} x_1 \\ \vdots \\ x_i \\ \vdots \\ x_n \end{bmatrix}, \quad \mathbf{A} = \begin{bmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} \\ \vdots & \ddots & & & \vdots \\ a_{i1} & \cdots & a_{ij} & \cdots & a_{in} \\ \vdots & & \ddots & & \vdots \\ a_{n1} & \cdots & a_{nj} & \cdots & a_{nn} \end{bmatrix}, \quad \mathbf{f} = \begin{bmatrix} f_1 \\ \vdots \\ f_i \\ \vdots \\ f_n \end{bmatrix}$$

45 If the solution to (2.4) exists, it is given by:

$$\mathbf{x} - \mathbf{Ax} = \mathbf{f} \tag{2.5}$$

$$\mathbf{x} = (\mathbf{I} - \mathbf{A})^{-1}\mathbf{f} \tag{2.6}$$

where \mathbf{I} denotes an identity matrix of suitable dimension. Let $\boldsymbol{\Theta} = (\mathbf{I} - \mathbf{A})^{-1}$ and (2.6) can be expressed compactly as:

$$\mathbf{x} = \boldsymbol{\Theta}\mathbf{f} \tag{2.7}$$

where:

$$\boldsymbol{\Theta} = \begin{bmatrix} \theta_{11} & \cdots & \theta_{1j} & \cdots & \theta_{1n} \\ \vdots & \ddots & & & \vdots \\ \theta_{i1} & \cdots & \theta_{ij} & \cdots & \theta_{in} \\ \vdots & & \ddots & & \vdots \\ \theta_{n1} & \cdots & \theta_{nj} & \cdots & \theta_{nn} \end{bmatrix}$$

46 Matrix \mathbf{A} is commonly known as the direct requirements coefficients matrix. $(\mathbf{I} - \mathbf{A})^{-1}$ or $\boldsymbol{\Theta}$ is the Leontief inverse which is also known as the total requirements coefficients matrix. Each θ_{ij} in matrix $\boldsymbol{\Theta}$ measures the dependency of sector j on the output of sector i when final demand for its good or service increases by a dollar.

B. Closed Model

47 In the closed model, households are considered to be endogenous in the production process. Instead of an n by n matrix of input coefficients, $\mathbf{A} = \{a_{ij}\}$ where $i=1,2,\dots,n$ and $j=1,2,\dots,n$, the closed model is characterised by an $(n+1)$ by $(n+1)$ dimension matrix, $\bar{\mathbf{A}}$.

48 To accommodate this modification, we need to include a vector of private consumption expenditure, $\mathbf{c} = \{c_1, c_2, \dots, c_n\}$, as the $(n+1)^{\text{th}}$ column and a vector of wages, $\mathbf{w} = \{w_1, w_2, \dots, w_n\}$ as the $(n+1)^{\text{th}}$ row. The new final demand vector, after excluding private consumption expenditure, is $\tilde{\mathbf{f}} = \{\tilde{f}_1, \tilde{f}_2, \dots, \tilde{f}_n\}$.

49 This modification leads to the system of equations (2.8) below.

$$\begin{aligned} x_1 &= z_{11} + z_{12} + \dots + z_{1n} + c_1 + \tilde{f}_1 \\ x_2 &= z_{21} + z_{22} + \dots + z_{2n} + c_2 + \tilde{f}_2 \\ &\dots \\ x_n &= z_{n1} + z_{n2} + \dots + z_{nn} + c_n + \tilde{f}_n \\ W &= w_1 + w_2 + \dots + w_n \end{aligned} \tag{2.8}$$

50 Similar to deriving input coefficients, we derive a consumption coefficient which is consumption per unit wage. The consumption share of sector i to total wages is $c_{i,n+1} = c_i / W$, where W equals the total wages paid by all sectors. c_i can also be expressed as $c_i = c_{i,n+1}W$.

51 The wage coefficient which is the wage per unit of output for sector j is simply $\omega_j = w_j / x_j$ or $\omega_j x_j = w_j$. Substituting for c_i and w_j in the system of equations (2.8), we get:

$$\begin{aligned} x_1 &= a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n + c_{1,n+1}W + \tilde{f}_1 \\ x_2 &= a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n + c_{2,n+1}W + \tilde{f}_2 \\ &\dots \\ x_n &= a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n + c_{n,n+1}W + \tilde{f}_n \\ W &= \omega_1x_1 + \omega_2x_2 + \dots + \omega_nx_n \end{aligned} \tag{2.9}$$

52 In matrix notation, equation (2.9) can be represented as:

$$\bar{\mathbf{x}} = \bar{\mathbf{A}}\bar{\mathbf{x}} + \tilde{\mathbf{f}} \tag{2.10}$$

where:

$$\bar{\mathbf{x}} = \begin{bmatrix} x_1 \\ \vdots \\ x_i \\ \vdots \\ x_n \\ W \end{bmatrix}, \quad \bar{\mathbf{A}} = \begin{bmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} & c_{1,n+1} \\ \vdots & \ddots & \vdots & & \vdots & \vdots \\ a_{i1} & \cdots & a_{ij} & \cdots & a_{in} & c_{i,n+1} \\ \vdots & & \vdots & \ddots & \vdots & \vdots \\ a_{n1} & \cdots & a_{nj} & \cdots & a_{nn} & c_{n,n+1} \\ \omega_1 & \cdots & \omega_j & \cdots & \omega_n & 0 \end{bmatrix}, \quad \bar{\mathbf{f}} = \begin{bmatrix} \tilde{f}_1 \\ \vdots \\ \tilde{f}_i \\ \vdots \\ \tilde{f}_n \\ 0 \end{bmatrix}$$

53 This new matrix denoted by $\bar{\mathbf{A}}$ has an additional column of consumption coefficients and an additional wage coefficients row. W is a scalar of the total wages paid by the n sectors.

54 If inverse $(\mathbf{I} - \bar{\mathbf{A}})^{-1}$ exists, then $(\mathbf{I} - \bar{\mathbf{A}})^{-1}$ is defined as the closed inverse matrix.

$$\bar{\mathbf{x}} = (\mathbf{I} - \bar{\mathbf{A}})^{-1} \bar{\mathbf{f}} \quad (2.11)$$

55 Or letting $(\mathbf{I} - \bar{\mathbf{A}})^{-1} = \bar{\Psi}$, this can be expressed compactly as:

$$\bar{\mathbf{x}} = \bar{\Psi} \bar{\mathbf{f}} \quad (2.12)$$

56 In input-output analysis, the last column of the closed inverse is known as the consumption multiplier and the last row is the household income multiplier. The remaining rows and columns of the closed inverse, which correspond to the rows and columns of the open inverse represent the industrial sectors. In order to compare the closed model inverse to the open model inverse, the consumption multiplier and household income multiplier of the closed inverse are dropped. This gives us a truncated closed inverse Ψ which satisfies:

$$\mathbf{x} = \Psi \tilde{\mathbf{f}} \quad (2.13)$$

where:

$$\Psi = \begin{bmatrix} \psi_{11} & \cdots & \psi_{1j} & \cdots & \psi_{1n} \\ \vdots & \ddots & & & \vdots \\ \psi_{i1} & \cdots & \psi_{ij} & \cdots & \psi_{in} \\ \vdots & & \ddots & & \vdots \\ \psi_{n1} & \cdots & \psi_{nj} & \cdots & \psi_{nn} \end{bmatrix}, \quad \tilde{\mathbf{f}} = \begin{bmatrix} \tilde{f}_1 \\ \vdots \\ \tilde{f}_i \\ \vdots \\ \tilde{f}_n \end{bmatrix}$$

57 Each ψ_{ij} in matrix Ψ measures the dependency of sector j on the output of sector i when exogenous final demand (excluding private consumption expenditure) for its good or service increases by a dollar.

III. Derivation of Applications of Input-Output Tables

A. Multipliers

58 Multiplier analysis is used in input-output analysis to determine the effect of changes in variables that are exogenous to the model of the economy. In the Leontief model, changes in final demand variables are assumed to be exogenous and are determined outside the system. A change in the demand for exports is an example of an exogenous change.

59 Multipliers can be generated from two different models, namely the open and closed model. The multipliers generated using the open model are known as simple or Leontief multipliers and they measure both the direct and indirect effects of a change in final demand.

60 The closed model captures the direct and indirect effects as well as the induced effects due to a change in final demand. Closed model multipliers are known as total multipliers or Leontief-Keynes multipliers.

61 The frequently used multipliers are those that estimate the effects of exogenous changes on (a) the output of different sectors in the economy; (b) the value-added or income in each sector; (c) the imports in each sector; and (d) the employment in each sector.

i) *Output Multiplier*

62 An output multiplier for sector j is defined as the total value of production for all sectors of the economy that is necessary in order to satisfy a dollar's worth of final demand for sector j 's output.

63 Recalling equation (2.3) reproduced below as (3.1):

$$\begin{aligned}x_1 &= \theta_{11}f_1 + \theta_{12}f_2 + \dots + \theta_{1n}f_n \\x_2 &= \theta_{21}f_1 + \theta_{22}f_2 + \dots + \theta_{2n}f_n \\&\dots \\x_n &= \theta_{n1}f_1 + \theta_{n2}f_2 + \dots + \theta_{nn}f_n\end{aligned}\tag{3.1}$$

64 If $\Delta f_j = 1$, the total change in gross output in the economy due to a dollar increase in final demand for the product of sector j can be derived by summing the θ_{ij} 's for sector j . Thus, the gross output multipliers for n sectors is $\sum_{i=1}^n \theta_{ij}$. This is equivalent to summing the elements in the j^{th} column of the Leontief inverse, Θ .

65 In matrix notation, the gross output multipliers for each of the n sectors of the economy are given by the entries of the vector $\mathbf{e}'\Theta$. Similarly, the corresponding closed model gross output multipliers are $\mathbf{e}'\Psi$.

ii) Value-Added Multiplier

66 Value-added (VA) multipliers show the proportion of VA generated in the supplying industries. VA multipliers translate the impact of final demand expenditure changes into changes in VA. The interpretation of VA multipliers is similar to income multipliers as income (i.e. compensation of employees) is a component of VA. In contrast to VA and income multipliers, output multipliers translate changes in final demand into the total value of sectoral output.

67 By the homogeneity and proportionality assumptions, we can treat VA, income, imports as well as employment as inputs into the production process.

68 The VA coefficient for sector j is derived by dividing the VA of sector j by the industry output of sector j . This gives $v_j = y_j / x_j$. Thus if v_1, v_2, \dots, v_n represent the VA coefficients of sectors 1 to n respectively, then the VA derived from the production of x_1, x_2, \dots, x_n would be $v_1 x_1, v_2 x_2, \dots, v_n x_n$ respectively.

69 Multiplying each individual equation in (3.1) by the respective VA coefficients, the following system of equations is derived:

$$\begin{aligned} v_1 x_1 &= v_1 (\theta_{11} f_1 + \theta_{12} f_2 + \dots + \theta_{1n} f_n) \\ v_2 x_2 &= v_2 (\theta_{21} f_1 + \theta_{22} f_2 + \dots + \theta_{2n} f_n) \\ &\dots \\ v_n x_n &= v_n (\theta_{n1} f_1 + \theta_{n2} f_2 + \dots + \theta_{nn} f_n) \end{aligned} \quad (3.2)$$

70 The left hand side of each equation is the VA of sector i generated at a level of gross total output. If $\Delta f_j = 1$, the total change in VA in the economy due to a dollar increase in final demand for the product of sector j can be derived by summing the $v_i \theta_{ij}$'s for sector j . The VA multiplier for sector j is $\sum_{i=1}^n v_i \theta_{ij}$ and the VA dependency of sector i on sector j is $v_i \theta_{ij}$.

71 Let $\mathbf{y} = \{y_1, y_2, \dots, y_n\}$ be a row vector of VA, and $\mathbf{v} = \{v_1, v_2, \dots, v_n\}$ be the row vector of VA coefficients $v_j = y_j / x_j$. Pre-multiplying $\hat{\mathbf{v}}$ to equation (2.7) $\mathbf{x} = \Theta \mathbf{f}$, we get:

$$\hat{\mathbf{v}} \mathbf{x} = \hat{\mathbf{v}} \Theta \mathbf{f} \quad (3.3)$$

72 $\hat{\mathbf{v}} \mathbf{x}$ represents the VA of sector i (where $i = 1, 2, \dots, n$) generated at a level of gross total output. If $\Delta \mathbf{f} = \mathbf{1}$, $\hat{\mathbf{v}} \Theta$ represents the matrix of direct and indirect requirements for VA, and the VA multipliers for all n sectors of the economy is simply $\mathbf{e}' \hat{\mathbf{v}} \Theta = \mathbf{v} \Theta$.

73 Similarly, for the closed model, $\hat{\mathbf{v}} \Psi$ represents the matrix of total (direct, indirect and induced) requirements for VA. The closed model VA multiplier is $\mathbf{v} \Psi$.

iii) Income Multiplier

74 The income multiplier for a given industry is defined as the total value of compensation of employees (i.e. employee wages) required to satisfy a dollar's worth of final demand for the output of that industry. Similar to the VA, we can treat wages as an input into the production process.

75 The wage coefficient for sector j is derived by dividing the wages paid by sector j by the industry output of sector j . This gives $\omega_j = w_j / x_j$. Thus if $\omega_1, \omega_2, \dots, \omega_n$ represent the wage coefficients of sector 1 to n respectively, then the income derived from the production of x_1, x_2, \dots, x_n would be $\omega_1 x_1, \omega_2 x_2, \dots, \omega_n x_n$ respectively.

76 Multiplying each individual equation in (3.1) by the respective wage coefficients, the following system of equations is derived:

$$\begin{aligned}\omega_1 x_1 &= \omega_1 (\theta_{11} f_1 + \theta_{12} f_2 + \dots + \theta_{1n} f_n) \\ \omega_2 x_2 &= \omega_2 (\theta_{21} f_1 + \theta_{22} f_2 + \dots + \theta_{2n} f_n) \\ &\dots \\ \omega_n x_n &= \omega_n (\theta_{n1} f_1 + \theta_{n2} f_2 + \dots + \theta_{nn} f_n)\end{aligned}\tag{3.4}$$

77 The left hand side of each equation are the wages of sector i generated at a level of gross total output. If $\Delta f_j = 1$, the total change in wages in the economy due to a dollar increase in final demand for the product of sector j can be derived by summing the $\omega_i \theta_{ij}$'s for sector j . The income multiplier for sector j is $\sum_{i=1}^n \omega_i \theta_{ij}$ and the income dependency of sector i on sector j is $\omega_i \theta_{ij}$.

78 Let $\mathbf{w} = \{w_1, w_2, \dots, w_n\}$ be a row vector of wages, and $\boldsymbol{\omega} = \{\omega_1, \omega_2, \dots, \omega_n\}$ be the row vector of wage coefficients $\omega_j = w_j / x_j$. Pre-multiplying $\hat{\boldsymbol{\Theta}}$ to equation (2.7) $\mathbf{x} = \boldsymbol{\Theta} \mathbf{f}$, we get:

$$\hat{\boldsymbol{\Theta}} \mathbf{x} = \hat{\boldsymbol{\omega}} \boldsymbol{\Theta} \mathbf{f}\tag{3.5}$$

79 $\hat{\boldsymbol{\Theta}} \mathbf{x}$ represents the wages of sector i (where $i = 1, 2, \dots, n$) generated at a level of gross total output. If $\Delta \mathbf{f} = \mathbf{1}$, $\hat{\boldsymbol{\Theta}} \boldsymbol{\Theta}$ represents the matrix of direct and indirect requirements for income, and the income multipliers for all n sectors of the economy is $\mathbf{e}' \hat{\boldsymbol{\Theta}} \boldsymbol{\Theta} = \boldsymbol{\omega} \boldsymbol{\Theta}$.

80 Similarly, for the closed model, $\hat{\boldsymbol{\omega}} \boldsymbol{\Psi}$ represents the matrix of total (direct, indirect and induced) requirements for income. The closed model income multiplier is $\boldsymbol{\omega} \boldsymbol{\Psi}$.

iv) Import Multiplier

81 Import multipliers show the total change in imports when final demand changes by one dollar. Similar to the VA and income, imports can be treated as an input into the production process.

82 The import coefficient for sector j is derived by dividing the imports purchased by sector j by the industry output of sector j . This gives $\eta_j = m_j / x_j$. Thus if the import coefficients of the n sectors are represented by $\eta_1, \eta_2, \dots, \eta_n$ respectively, then the imports used in the production x_1, x_2, \dots, x_n are $\eta_1 x_1, \eta_2 x_2, \dots, \eta_n x_n$, respectively.

83 Similarly, by multiplying the equations in (3.1) by the import coefficients, the following system of equations is derived:

$$\begin{aligned}\eta_1 x_1 &= \eta_1(\theta_{11} f_1 + \theta_{12} f_2 + \dots + \theta_{1n} f_n) \\ \eta_2 x_2 &= \eta_2(\theta_{21} f_1 + \theta_{22} f_2 + \dots + \theta_{2n} f_n) \\ &\dots \\ \eta_n x_n &= \eta_n(\theta_{n1} f_1 + \theta_{n2} f_2 + \dots + \theta_{nn} f_n)\end{aligned}\tag{3.6}$$

84 The left hand side of each equation are the imports of sector i generated at a level of gross total output. If $\Delta f_j = 1$, the total change in imports in the economy due to a dollar increase in final demand for the product of sector j can be derived by summing the $\eta_i \theta_{ij}$'s for sector j . The import multiplier for sector j is $\sum_{i=1}^n \eta_i \theta_{ij}$ and the import dependency of sector i on sector j is $\eta_i \theta_{ij}$.

85 Let $\mathbf{m} = \{m_1, m_2, \dots, m_n\}$ be a row vector of imports, and $\boldsymbol{\eta} = \{\eta_1, \eta_2, \dots, \eta_n\}$ be the row vector of import coefficients $\eta_j = m_j / x_j$. Pre-multiplying $\hat{\boldsymbol{\eta}}$ to $\mathbf{x} = \Theta \mathbf{f}$, we get:

$$\hat{\boldsymbol{\eta}} \mathbf{x} = \hat{\boldsymbol{\eta}} \Theta \mathbf{f}\tag{3.7}$$

86 $\hat{\boldsymbol{\eta}} \mathbf{x}$ represents the imports of sector i (where $i = 1, 2, \dots, n$) generated at a level of gross total output. If $\Delta \mathbf{f} = \mathbf{1}$, $\hat{\boldsymbol{\eta}} \Theta$ represents the matrix of direct and indirect requirements for imports, and the import multipliers for all n sectors of the economy is simply $\mathbf{e}' \hat{\boldsymbol{\eta}} \Theta = \boldsymbol{\eta} \Theta$.

87 Similarly, for the closed model, $\hat{\boldsymbol{\eta}} \Psi$ represents the matrix of total (direct, indirect and induced) requirements for imports. The closed model income multiplier is $\boldsymbol{\eta} \Psi$.

v) Employment Multiplier

88 Employment multipliers are derived in the same way as VA or income multipliers. Employment multipliers show the number of employment (in thousands) created as a result of a million dollar increase in final demand.

89 The employment per unit output ratio is derived by dividing the number of employed persons of sector j by the industry output of sector j . This gives $\rho_j = l_j / x_j$. The employment derived from the production of x_1, x_2, \dots, x_n in each of the n sectors are $\rho_1 x_1, \rho_2 x_2, \dots, \rho_n x_n$, respectively.

90 These simultaneous equations can be derived from equation (3.1):

$$\begin{aligned}\rho_1 x_1 &= \rho_1(\theta_{11}f_1 + \theta_{12}f_2 + \dots + \theta_{1n}f_n) \\ \rho_2 x_2 &= \rho_2(\theta_{21}f_1 + \theta_{22}f_2 + \dots + \theta_{2n}f_n) \\ &\dots \\ \rho_n x_n &= \rho_n(\theta_{n1}f_1 + \theta_{n2}f_2 + \dots + \theta_{nn}f_n)\end{aligned}\tag{3.8}$$

91 The left hand side of each equation is the employment of sector i generated at a level of gross total output. If $\Delta f_j = 1$, the total change in employment in the economy due to a dollar increase in final demand for the product of sector j can be derived by summing the $\rho_i \theta_{ij}$'s for sector j . The employment multiplier for sector j is $\sum_{i=1}^n \rho_i \theta_{ij}$ and the employment dependency of sector i on sector j is $\rho_i \theta_{ij}$.

92 Let $\mathbf{l} = \{l_1, l_2, \dots, l_n\}$ be the row vector of employed persons per sector, and $\mathbf{\rho} = \{\rho_1, \rho_2, \dots, \rho_n\}$ be a row vector of employment coefficients. Pre-multiplying $\hat{\mathbf{\rho}}$ to equation (2.7) $\mathbf{x} = \mathbf{\Theta f}$ we get:

$$\hat{\mathbf{\rho}} \mathbf{x} = \hat{\mathbf{\rho}} \mathbf{\Theta f}\tag{3.9}$$

93 $\hat{\mathbf{\rho}} \mathbf{x}$ represents the employment of sector i (where $i = 1, 2, \dots, n$) generated at a level of gross total output. If $\Delta \mathbf{f} = \mathbf{l}$, $\hat{\mathbf{\rho}} \mathbf{\Theta}$ represents the matrix of direct and indirect requirements for employment, and the employment multipliers for all n sectors of the economy is simply $\mathbf{e}' \hat{\mathbf{\rho}} \mathbf{\Theta} = \mathbf{\rho} \mathbf{\Theta}$.

94 Similarly, for the closed model, $\hat{\mathbf{\rho}} \Psi$ represents the matrix of total (direct, indirect and induced) requirements for employment. The closed model employment multiplier is $\mathbf{\rho} \Psi$.

B. Backward and Forward Linkages

95 Another application of I-O tables is linkage analysis. Linkage analysis help to identify key sectors in an economy by providing an average measure of the potential stimulus to other sectors from investment in a particular sector.

i) Backward Linkages

96 Backward linkages capture the changes in output that occur in supply sectors when there is a change in the sector using the supplying sectors' outputs as inputs in their production process. For example, if sector j increases its output, its demand for other sectors' inputs which are used in its production process increases. This is the direction of causation from the demand side perspective and is known as backward linkage.

97 The backward linkage of the j^{th} sector is computed by dividing the gross output multiplier for that sector by the average gross output multiplier for all sectors in the economy. In an n -sector economy, this is:

$$\frac{\sum_{i=1}^n \theta_{ij}}{\frac{1}{n} \sum_{j=1}^n \sum_{i=1}^n \theta_{ij}} \quad (4.1)$$

98 Note that the sum of all backward linkages for an n -sector economy is n . A sector with a high backward linkage will find it easier to source its inputs from all sectors in the economy. In matrix notation, the vector of backward linkages is:

$$\frac{n}{|\mathbf{e}'\Theta\mathbf{e}|} \mathbf{e}'\Theta \quad (4.2)$$

ii) Forward Linkages

99 Forward linkages capture the changes in output when there is a change in the sectors supplying output which are used as inputs in the production process of other sectors.

100 Using the demand side model, forward linkage of the i^{th} sector can be computed by dividing the row total of all θ_{ij} 's in the i^{th} row in the Leontief inverse, $(\mathbf{I} - \mathbf{A})^{-1}$ or Θ , by the average gross output multiplier for all sectors in the economy:

$$\frac{\sum_{j=1}^n \theta_{ij}}{\frac{1}{n} \sum_{i=1}^n \sum_{j=1}^n \theta_{ij}} \quad (4.3)$$

101 The vector of forward linkages can be expressed compactly as:

$$\frac{n}{|\mathbf{e}'\Theta\mathbf{e}|} \Theta\mathbf{e} \quad (4.4)$$

102 As in the backward linkage, the sum of all forward linkages for an n -sector economy is n . A sector with a high forward linkage will find it easier to sell its output as inputs to all sectors in the economy. However, the assumption that final demand for all sectors increase by unity is inherent in the computation of forward linkage using the above formula. This assumption is unrealistic as different sectors are not all equally important in the demand structure.

103 Alternatively, the estimate for the forward linkage is improved by replacing the assumption of a fixed input structure with the assumption of a fixed output structure. This can be formulated as a supply driven model.

104 Supply driven models relate sectoral output to primary inputs. The core assumption is that output distribution patterns of inter-industry flows are proportionally fixed by sectoral origin.

105 This can be understood by the equations below which relate sector j 's purchases of sector i 's output to purchases of primary inputs. Let $\mathbf{p} = \{p_1, p_2, \dots, p_n\}$ be the row vector of primary inputs including imports. Then:

$$\begin{aligned} x_1 &= z_{11} + z_{21} + \dots + z_{i1} + \dots + z_{n1} + p_1 \\ x_2 &= z_{12} + z_{22} + \dots + z_{i2} + \dots + z_{n2} + p_2 \\ &\dots \\ x_j &= z_{1j} + z_{2j} + \dots + z_{ij} + \dots + z_{nj} + p_j \\ &\dots \\ x_n &= z_{1n} + z_{2n} + \dots + z_{in} + \dots + z_{nn} + p_n \end{aligned} \tag{4.5}$$

106 Deriving the output coefficients, $b_{ji} = z_{ij}/x_i$, where b_{ji} measures the amount of output from sector i required by sector j as a ratio of sector i 's gross output. The b_{ji} are different from the earlier direct requirements coefficients a_{ij} in that z_{ij} is divided by the output of sector i and not the output of sector j . Then the supply side equations can be re-expressed as:

$$\begin{aligned} x_1 &= b_{11}x_1 + b_{12}x_2 + \dots + b_{1i}x_i + \dots + b_{1n}x_n + p_1 \\ x_2 &= b_{21}x_1 + b_{22}x_2 + \dots + b_{2i}x_i + \dots + b_{2n}x_n + p_2 \\ &\dots \\ x_j &= b_{j1}x_1 + b_{j2}x_2 + \dots + b_{ji}x_i + \dots + b_{jn}x_n + p_j \\ &\dots \\ x_n &= b_{n1}x_1 + b_{n2}x_2 + \dots + b_{ni}x_i + \dots + b_{nn}x_n + p_n \end{aligned} \tag{4.6}$$

107 Solving the system of equations, we get:

$$\begin{aligned} x_1 &= \lambda_{11}p_1 + \lambda_{12}p_2 + \dots + \lambda_{1i}p_i + \dots + \lambda_{1n}p_n \\ x_2 &= \lambda_{21}p_1 + \lambda_{22}p_2 + \dots + \lambda_{2i}p_i + \dots + \lambda_{2n}p_n \\ &\dots \\ x_j &= \lambda_{j1}p_1 + \lambda_{j2}p_2 + \dots + \lambda_{ji}p_i + \dots + \lambda_{jn}p_n \\ &\dots \\ x_n &= \lambda_{n1}p_1 + \lambda_{n2}p_2 + \dots + \lambda_{ni}p_i + \dots + \lambda_{nn}p_n \end{aligned} \tag{4.7}$$

108 Each λ_{ji} measures the dependency of sector j on the output of sector i due to a dollar increase in p_j . In matrix algebra, (4.5) can be expressed as:

$$\mathbf{x} = (\mathbf{e}' \mathbf{Z})' + \mathbf{p} \tag{4.8}$$

109 Let \mathbf{B} be the matrix of output coefficients or $\mathbf{B} = \hat{\mathbf{x}}^{-1} \mathbf{Z}$. This implies $\hat{\mathbf{x}} \mathbf{B} = \mathbf{Z}$ and substituting this into the equation (4.8), we get:

$$\mathbf{x} = \mathbf{B}' \mathbf{x} + \mathbf{p} \tag{4.9}$$

which concisely expresses (4.6). If an inverse exists, then the solution to (4.9) is:

$$\mathbf{x} = (\mathbf{I} - \mathbf{B}')^{-1} \mathbf{p} \quad (4.10)$$

110 Let $(\mathbf{I} - \mathbf{B}')^{-1} = \mathbf{\Lambda}$, thus:

$$\mathbf{x} = \mathbf{\Lambda} \mathbf{p} \quad (4.11)$$

where:

$$\mathbf{\Lambda} = \begin{bmatrix} \lambda_{11} & \cdots & \lambda_{1i} & \cdots & \lambda_{1n} \\ \vdots & \ddots & & & \vdots \\ \lambda_{j1} & \cdots & \lambda_{ji} & \cdots & \lambda_{jn} \\ \vdots & & & \ddots & \vdots \\ \lambda_{n1} & \cdots & \lambda_{ni} & \cdots & \lambda_{nn} \end{bmatrix}$$

111 Each λ_{ji} in the inverse represents the change in total output of sector i in response to a dollar change in value-added available to sector j as an input in production. Thus the exogenous variables are primary inputs of the economy, whereas the exogenous variables in the Leontief system are final demand components.

112 The new measure for the alternate forward linkage of sector i is:

$$\frac{\sum_{j=1}^n \lambda_{ji}}{\frac{1}{n} \sum_{i=1}^n \sum_{j=1}^n \lambda_{ji}} \quad (4.12)$$

113 In more compact form, the vector of alternate forward linkages is:

$$\frac{n}{|\mathbf{e}' \mathbf{\Lambda} \mathbf{e}|} \mathbf{e}' \mathbf{\Lambda} \quad (4.13)$$

114 The above is an improvement over the conventional measure of forward linkage as it traces the output increase in all using sectors rather than the output increase in the supplying sector only.

115 The coefficients of variation (CV) of input and output dependencies (θ_{ij} and λ_{ji} respectively) within a given sector are good indicators of the benefits of expansion in a sector to all sectors in the economy. The CV for a sample of observations can be obtained by dividing the standard error by the sample mean. Low CV's for input and output dependencies in a sector would indicate an even spread of benefits to other sectors in the economy.

116 For an n -sector economy, the coefficient of variation for the backward linkage is:

$$\frac{\sqrt{\frac{1}{n-1} \sum_{i=1}^n (\theta_{ij} - \frac{1}{n} \sum_{i=1}^n \theta_{ij})^2}}{\frac{1}{n} \sum_{i=1}^n \theta_{ij}} \quad (4.14)$$

117 The coefficient of variation for the alternate forward linkage is:

$$\frac{\sqrt{\frac{1}{n-1} \sum_{j=1}^n (\lambda_{ji} - \frac{1}{n} \sum_{j=1}^n \lambda_{ji})^2}}{\frac{1}{n} \sum_{j=1}^n \lambda_{ji}} \quad (4.15)$$

118 Their matrix counterparts respectively are:

$$\frac{n \left(\sqrt{\left\langle \frac{\Theta' Q \Theta}{n-1} \right\rangle} e \right)}{(e' \Theta)'} \quad (4.16)$$

$$\frac{n \left(\sqrt{\left\langle \frac{\Lambda' Q \Lambda}{n-1} \right\rangle} e \right)}{(e' \Lambda)'} \quad (4.17)$$

where $\mathbf{Q} = \left(\mathbf{I} - \frac{1}{n} \mathbf{ee}' \right)$, the matrix with all diagonal elements equal to $(1 - \frac{1}{n})$ and all off-diagonal elements equal to $(-\frac{1}{n})$.

C. Net Foreign Exchange Earnings

119 Exports make up one component of the exogenous final demand for domestic production, and foreign exchange earnings accrue as a direct result of this demand. However, in the process of producing goods and services for export, sectors make use of imports from the rest of the world. Net foreign exchange earnings are computed as the foreign exchange earnings as a result of export demand, less the imports used to fulfil this demand.

120 In this section we will derive the net foreign exchange earnings from the exports of goods and services for the various industries. Recalling (3.6) reproduced below as (5.1):

$$\begin{aligned}\eta_1 x_1 &= \eta_1(\theta_{11}f_1 + \theta_{12}f_2 + \dots + \theta_{1n}f_n) \\ \eta_2 x_2 &= \eta_2(\theta_{21}f_1 + \theta_{22}f_2 + \dots + \theta_{2n}f_n) \\ &\dots \\ \eta_n x_n &= \eta_n(\theta_{n1}f_1 + \theta_{n2}f_2 + \dots + \theta_{nn}f_n)\end{aligned}\tag{5.1}$$

121 The final demand f_i for the output of sector i can be divided into a domestic component f_i^d and an export component f_i^x or $f_i = f_i^d + f_i^x$. Substituting this into (5.1) we get:

$$\begin{aligned}\eta_1 x_1 &= \eta_1[\theta_{11}(f_1^d + f_1^x) + \theta_{12}(f_2^d + f_2^x) + \dots + \theta_{1n}(f_n^d + f_n^x)] \\ \eta_2 x_2 &= \eta_2[\theta_{21}(f_1^d + f_1^x) + \theta_{22}(f_2^d + f_2^x) + \dots + \theta_{2n}(f_n^d + f_n^x)] \\ &\dots \\ \eta_n x_n &= \eta_n[\theta_{n1}(f_1^d + f_1^x) + \theta_{n2}(f_2^d + f_2^x) + \dots + \theta_{nn}(f_n^d + f_n^x)]\end{aligned}\tag{5.2}$$

122 The import requirement from sector i for a dollar of exports from sector j can be written as:

$$\begin{aligned}\sigma_1 &= \eta_1 \theta_{11} f_1^x + \eta_1 \theta_{12} f_2^x + \dots + \eta_1 \theta_{1n} f_n^x \\ \sigma_2 &= \eta_2 \theta_{21} f_1^x + \eta_2 \theta_{22} f_2^x + \dots + \eta_2 \theta_{2n} f_n^x \\ &\dots \\ \sigma_n &= \eta_n \theta_{n1} f_1^x + \eta_n \theta_{n2} f_2^x + \dots + \eta_n \theta_{nn} f_n^x\end{aligned}\tag{5.3}$$

where $\sum_{j=1}^n f_j^x = 1$.

123 The total imports required by all sectors in order to produce f_j^x of exports in sector j will be $f_j^x \times \sum_{i=1}^n \eta_i \theta_{ij}$. The net foreign exchange earnings from the export of f_j^x is $f_j^x \times (1 - \sum_{i=1}^n \eta_i \theta_{ij})$.

124 In matrix terms, equation (5.3) $\sigma = \hat{\eta} \Theta f^x$ gives the formula for the import requirements due to exogenous final demand. The import requirements to fulfil exports f^x

are thus equal to σ . Accordingly, the net foreign exchange earnings are given by subtracting these import requirements from the export value, and are given by $\mathbf{f}^x - \sigma$.

IV. Updating Input-Output Tables – The RAS Method

125 The RAS method is an iterative procedure which utilises a set of known row and column totals to successively scale rows and columns in the intermediate transactions coefficient matrix, \mathbf{A} , until the matrix is fully reconciled with the column and row totals. It is widely used to update I-O tables on the basis of an earlier benchmark table. In this section, we explain the RAS procedure in the context of deriving an estimate of the matrix \mathbf{A}^* for year 1, based on the reference matrix \mathbf{A} for year 0.

Notation

\mathbf{x}	$(n \times 1)$ vector of total sales (or output) by industry for year 1. $\mathbf{x} = \{x_i\}$ where $i=1,2,\dots,n$. \mathbf{x} is also equal to the vector of total purchases (or inputs) by sector for year 1.
\mathbf{A}^{-1}	Inverse of a matrix.
$\hat{\mathbf{v}}$	Diagonalisation of a vector.
\mathbf{e}	$(n \times 1)$ vector of 1's.
\mathbf{u}^*	$(n \times 1)$ vector of known total inter-industry sales for year 1.
\mathbf{v}^*	$(1 \times n)$ vector of known total inter-industry purchases for year 1.
\mathbf{A}	$(n \times n)$ matrix of known intermediate transactions in coefficient form for year 0.
\mathbf{A}^*	$(n \times n)$ matrix of unknown intermediate transactions in coefficient form for year 1. The objective is to derive an estimate of this matrix.
\mathbf{A}^k	k^{th} iterative estimate of \mathbf{A}^* , where $k = 0,1,2,\dots$

A. The RAS Method

126 The RAS method is used to estimate the technical coefficients for year 1, a_{ij}^* , by adjusting the coefficients for year 0, a_{ij} , to fit the known total inter-industry sales and purchases \mathbf{u}^* and \mathbf{v}^* . Note that \mathbf{u}^* and \mathbf{v}^* are the (known) row totals and column totals of the (as yet unknown) matrix $\mathbf{A}^* \hat{\mathbf{x}}$ respectively.

127 The initial estimate \mathbf{A}^0 is simply equal to the matrix for the previous year \mathbf{A} . However, in general, we have $\mathbf{A}^0 \hat{\mathbf{x}} \neq \mathbf{u}^*$ (i.e. the row sums of the matrix $\mathbf{A}^0 \hat{\mathbf{x}}$ do not match

the known row sums for year 1. The first iterative estimate for \mathbf{A} , \mathbf{A}^1 , is obtained by adjusting the elements of \mathbf{A}^0 by rows, such that the row sums of $\mathbf{A}^1\hat{\mathbf{x}}$ fit the known inter-industry sales \mathbf{u}^* . If we define

$$\mathbf{u}^1 = \mathbf{A}^0 \hat{\mathbf{x}} \mathbf{e} \quad (6.1)$$

and

$$\mathbf{r}^1 = (\hat{\mathbf{u}}^1)^{-1} \mathbf{u}^* \quad (6.2)$$

then the matrix \mathbf{A}^1 is obtained by pre-multiplying \mathbf{A}^0 by $\hat{\mathbf{r}}^1$, the diagonalised vector of ratios of row sums:

$$\mathbf{A}^1 = \hat{\mathbf{r}}^1 \mathbf{A}^0 \quad (6.3)$$

128 Now the row sums of the matrix $\mathbf{A}^1\hat{\mathbf{x}}$ tally with \mathbf{u}^* . However, in general, the column sums would not tally with \mathbf{v}^* . The next estimate \mathbf{A}^2 is obtained by adjusting the elements of \mathbf{A}^1 by column such that the column sums of $\mathbf{A}^2\hat{\mathbf{x}}$ are equal to \mathbf{v}^* . If

$$\mathbf{v}^2 = \mathbf{e}' \mathbf{A}^1 \hat{\mathbf{x}} \quad (6.4)$$

and

$$\mathbf{s}^2 = \mathbf{v}^* (\hat{\mathbf{v}}^2)^{-1} \quad (6.5)$$

then the matrix \mathbf{A}^2 is defined by:

$$\mathbf{A}^2 = \mathbf{A}^1 \hat{\mathbf{s}}^2 \quad (6.6)$$

129 Or in a more recognisable form

$$\mathbf{A}^2 = \hat{\mathbf{r}}^1 \mathbf{A}^0 \hat{\mathbf{s}}^2 \quad (6.7)$$

$$\mathbf{A}^2 = \begin{bmatrix} r_1^1 & 0 & 0 & 0 & 0 \\ 0 & \ddots & 0 & 0 & 0 \\ 0 & 0 & r_i^1 & 0 & 0 \\ 0 & 0 & 0 & \ddots & 0 \\ 0 & 0 & 0 & 0 & r_n^1 \end{bmatrix} \begin{bmatrix} a_{11} & \cdots & a_{1j} & \cdots & a_{1n} \\ \vdots & \ddots & & & \vdots \\ a_{i1} & \cdots & a_{ij} & \cdots & a_{in} \\ \vdots & & & \ddots & \vdots \\ a_{n1} & \cdots & a_{nj} & \cdots & a_{nn} \end{bmatrix} \begin{bmatrix} s_1^2 & 0 & 0 & 0 & 0 \\ 0 & \ddots & 0 & 0 & 0 \\ 0 & 0 & s_j^2 & 0 & 0 \\ 0 & 0 & 0 & \ddots & 0 \\ 0 & 0 & 0 & 0 & s_n^2 \end{bmatrix}$$

130 However, while the column sums of $\mathbf{A}^2\hat{\mathbf{x}}$ have now been adjusted, the row sums will now require further adjustment, and this alternating process of adjusting rows and columns will continue until no further adjustments are necessary. In general, where k is even, we define

$$\mathbf{u}^{k+1} = \mathbf{A}^k \hat{\mathbf{x}} \mathbf{e} \quad (6.8)$$

$$\mathbf{r}^{k+1} = (\hat{\mathbf{u}}^{k+1})^{-1} \mathbf{u}^* \quad (6.9)$$

$$\mathbf{A}^{k+1} = \hat{\mathbf{r}}^{k+1} \mathbf{A}^k \quad (6.10)$$

to move to the next iterative estimate \mathbf{A}^{k+1} by adjusting the elements by rows, and where k is odd we define

$$\mathbf{v}^{k+1} = \mathbf{e}' \mathbf{A}^k \hat{\mathbf{x}} \quad (6.11)$$

$$\mathbf{s}^{k+1} = \mathbf{v}^* (\hat{\mathbf{v}}^{k+1})^{-1} \quad (6.12)$$

$$\mathbf{A}^{k+1} = \mathbf{A}^k \hat{\mathbf{s}}^{k+1} = \hat{\mathbf{r}}^k \mathbf{A}^{k-1} \hat{\mathbf{s}}^{k+1} \quad (6.13)$$

to move to the next estimate by adjusting the elements by columns.

131 The sequence of estimates $\mathbf{A}^0, \mathbf{A}^1, \mathbf{A}^2, \dots$ converges¹ and the resulting limit matrix is the estimate of \mathbf{A}^* , the intermediate transactions matrix in coefficient form for year 1.

$$\mathbf{A}^* = \lim_{k \rightarrow \infty} \mathbf{A}^k = \dots \hat{\mathbf{r}}^5 \hat{\mathbf{r}}^3 \hat{\mathbf{r}}^1 \mathbf{A}^0 \hat{\mathbf{s}}^2 \hat{\mathbf{s}}^4 \hat{\mathbf{s}}^6 \dots \quad (6.14)$$

B. Incorporating Exogenous Information

132 The RAS method can also be modified to estimate \mathbf{A}^* in the case where some of the a_{ij}^* 's are already known. If an element a_{ij}^* is known, then the corresponding element a_{ij} is set to zero before running the iterative steps, and the known elements are added back after the iterative limit is obtained.

133 Let Φ be the matrix \mathbf{A} except that $\Phi_{ij} = 0$ whenever a_{ij}^* is known, and Ω^* be the matrix with $\Omega_{ij}^* = a_{ij}^*$ whenever a_{ij}^* is known, and $\Omega^* = 0$ otherwise. The iterative procedure is now run on Φ in place of \mathbf{A} , and with:

$$\tilde{\mathbf{u}} = \mathbf{u}^* - \Omega^* \hat{\mathbf{x}} \mathbf{e} \quad (6.15)$$

$$\tilde{\mathbf{v}} = \mathbf{v}^* - \mathbf{e}' \Omega^* \hat{\mathbf{x}} \quad (6.16)$$

used in place of \mathbf{u}^* and \mathbf{v}^* respectively. After the iterative limit Φ^* is obtained, the known elements in Ω^* are added back and we get:

$$\mathbf{A}^* = \Omega^* + \Phi^* = \Omega^* + \dots \hat{\mathbf{r}}^5 \hat{\mathbf{r}}^3 \hat{\mathbf{r}}^1 \Phi \hat{\mathbf{s}}^2 \hat{\mathbf{s}}^4 \hat{\mathbf{s}}^6 \dots \quad (6.17)$$

¹ The proof that the matrices eventually converge is beyond the scope of this publication. For the proof and more details on the properties of these matrices, please refer to United Nations publication *Handbook of Input-Output Table Compilation and Analysis* (UN 1999).

SINGAPORE DEPARTMENT OF STATISTICS INFORMATION DISSEMINATION SERVICES

Statistics Singapore Website

The Statistics Singapore Website was launched by the Singapore Department of Statistics (DOS) in January 1995. Internet users can access the website by connecting to:

<http://www.singstat.gov.sg>

Key Singapore statistics are available via the following sections:

- ◆ Statistics
 - which provide key data on Singapore's economy and population.
- ◆ News
 - which cover the Performance of Singapore Economy, the Consumer Price Index, the Wholesale Trade Index, Business Receipts Index for Service Industries, Retail Sales and Catering Trade Indices, Manufacturing Performance, Singapore External Trade, Tourism Sector Performance, Real Estate Information and Employment Situation.
- ◆ Publications - Papers & Analyses
 - which provide papers on economic and social topics.
- ◆ Themes
 - which presents official statistics compiled by DOS and the Research and Statistics Units in the various ministries and statutory boards according to themes. Within each theme, relevant statistics and related press releases, publications and references are provided.

Statistical resources are available via:

- ◆ Publication Catalogue
 - which lists the latest editions of publications released by the Singapore Department of Statistics at <http://www.singstat.gov.sg/pubn/catalog.html>. All softcopy DOS publications are available for free downloading. Statistical tables of DOS publications in Excel format are also available.
- ◆ Advance Release Calendar
 - which covers key Singapore economic indicators.

The website also provides a convenient gateway to international statistical websites under the "Statistical Resources" section:

- ◆ Guide to International Statistics
 - which covers international databases, classifications and links, and statistical terms and definitions.
- ◆ IMF Dissemination Standards Bulletin Board
 - which provides metadata about Singapore's key indicators in the real, fiscal, financial and external sectors, including dissemination practices and information about pre-release access of current indicators.

SingStat Express

SingStat Express is a personalised data delivery service which sends the latest press releases, notices of publication, newsletter, occasional and information papers to subscribers via email. SMS alert service is also available to local users. Subscription details are available from the Statistics Singapore Website (www.singstat.gov.sg/express).

SINGAPORE DEPARTMENT OF STATISTICS INFORMATION DISSEMINATION SERVICES (continued)

Really Simple Syndication

Really Simple Syndication (RSS) is an easy way to stay updated on the latest statistical news released via the Statistics Singapore Website. The SingStat RSS feed delivers statistical news highlights and hyperlinks to the source documents whenever the updates are posted. More information are available at <http://www.singstat.gov.sg/svcs/rss.html>.

Data on SMS

Data on SMS is a free mobile service for local data users to receive the latest data for key indicators via SMS. Simply key **data** and SMS to 74688 (or SGOVT) for the service. More information is available at <http://www.singstat.gov.sg/svcs/dataonsms.html>.

SingStat Time Series (STS) Online System

The SingStat Time Series (STS) Online System is an internet-accessible time series retrieval system. The STS includes more than 7,000 historical data series on Singapore society and economy from several domains, including national accounts, balance of payments, investments, finance, labour, prices, business expectations, trade, manufacturing, tourism, demography, health and education.

Besides the usual monthly, quarterly and annual data, STS includes also seasonally adjusted data series for key economic indicators providing for a better analysis and understanding of current economic trends. The STS also offers:

- Web-based search engine that is easy to use;
- “Bookmark” features that enable users to save and organise links in their personalised portals.

Subscription to STS is opened to local and overseas users. More information on STS are available via Statistics Singapore Website. For enquiries, please contact our Department at **Tel : 6332-7119**.

E-survey

The E-survey enables business organisations to complete and submit their survey forms through the internet. Using secured encryption protocols, the E-survey ensures that the information transmitted through the net is secured and protected. The system features online helps and validation checks to assist respondents in completing their survey forms. With the E-survey, respondents do away with the tedious paper work and manual tasks of mailing or faxing their survey returns to the Department.

Statistical Enquiries and Feedback

If you have any statistical enquiries or comment or suggestions on our statistical publications and electronic services, you are welcomed to :

- ◆ E-mail us at **info@singstat.gov.sg**
- ◆ Fax to us at **(65) 6332-7689**
- ◆ Call us at **1800-3238118* (local callers)**
(65) 6332-7738 (overseas callers)

* Calls from mobile telephone lines to 1800 local toll free number may be subject to mobile airtime charges as imposed by the relevant mobile service provider.
