REBASING OF SINGAPORE MANUFACTURED PRODUCTS AND DOMESTIC SUPPLY PRICE INDICES (Base Year 2023 = 100)

I INTRODUCTION

The Department of Statistics (DOS) has rebased the Singapore Manufactured Products Price Index (SMPPI) and Domestic Supply Price Index (DSPI) from the base year of 2018 to 2023. The rebasing exercise is conducted periodically to ensure that the baskets of commodities remain representative amidst changing production and domestic supply patterns.

The SMPPI measures the changes in the prices of goods produced by manufacturers in Singapore for sale in the domestic and international markets. The SMPPI is used as a price deflator of manufacturing output in the compilation of the monthly Index of Industrial Production. The DSPI monitors the price changes of locally manufactured goods and imports which are retained for use in the domestic economy. It gives an indication of the price trends of goods used in the domestic economy.

This information paper provides details on the rebasing of the SMPPI and DSPI to reference year 2023. In addition, this paper compares the weighting patterns and trends of the 2023-based price indices with those of the 2018-based series.

II METHODOLOGY

Index Structure and Classification

The index structure of the SMPPI and DSPI is in accordance with the Standard International Trade Classification, Revision 4.1 (SITC Rev 4.1)¹. Figure 1 illustrates the structure of the SMPPI. The lowest level comprises the brand prices of the manufactured products. The indices at the 7-digit commodity item level and the attached weights form the elementary aggregates, from which the indices at the 3-digit group level, 2-digit division level, 1-digit section level and lastly the overall SMPPI are built up.

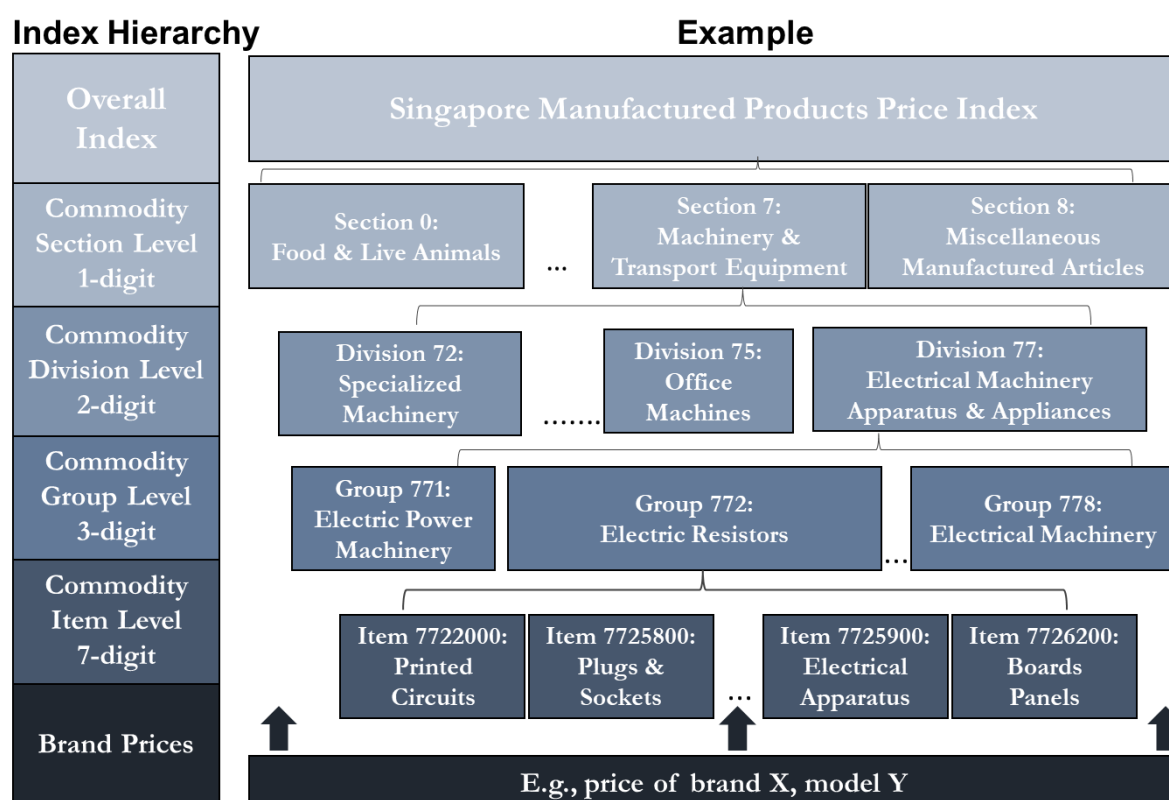

The DSPI is a composite index of the Import Price Index (IPI) and SMPPI. The index structure of the DSPI is similar to the SMPPI, except that the most disaggregated level for the DSPI is at the commodity item level.

¹ The Standard International Trade Classification is a product classification of the United Nations used for the publication of external trade statistics (export and import values and volumes of goods), allowing for international comparisons of commodities and manufactured goods. Information on the SITC v4.1 can be found at: www.stats.un.org/unsd/trade/sitcrev4.htm.

Weights Determination

The weights for the SMPPI at the 1-digit, 2-digit, 3-digit and 7-digit SITC levels, are derived from the 2022 Census of Manufacturing Activities (CMA)². At the brand level, equal weights are assigned to the individual brands within the elementary aggregates (sub-indices at the 7-digit commodity item level).

Figure 1: Index Structure of SMPPI

For the DSPI, the weights are based on the domestic supply of goods from external source, which is the retained imports, as well as from local source like the domestic production sales. Retained imports refers to the values of merchandise imports less re-exports in 2022 while domestic production sales is the total sales of local producers less the portion of export in 2022. The DSPI is derived from the price relatives of IPI and SMPPI at commodity item level together with their attached weights from retained imports and domestic production sales.

The SMPPI and DSPI baskets contain selected commodity items which are representative of the production and domestic supply patterns of Singapore. The weights of the non-selected commodity items are distributed across the appropriate commodity items that share similar product characteristics based on the assumption that price trends of similar items move in tandem.

Index Computation

The 2023-based series is compiled using the modified Laspeyres formula where the weight reference period of 2022 preceded the price reference period of 2023. For the SMPPI, the elementary aggregates are the geometric means of the price relatives of the commodity brands at the 7-digit commodity item level. Price indices at higher levels of aggregation for both the SMPPI and DSPI are then progressively built up from the arithmetic means of the weighted sub-indices at the 3-digit group level, 2-digit division level, and 1-digit section level to the overall index. Details on the index computation of the SMPPI and DSPI are shown in Appendix I.

Linking of Historical Series Across Different Base Years

The price indices prior to 2023 are linked to the new series by re-scaling them to the new base year 2023 level. The linking is obtained through the following mathematical procedure:

$$\text{Linked (2023-based) Index} = \text{2018-Based Index} \times \text{Linked Coefficient}$$

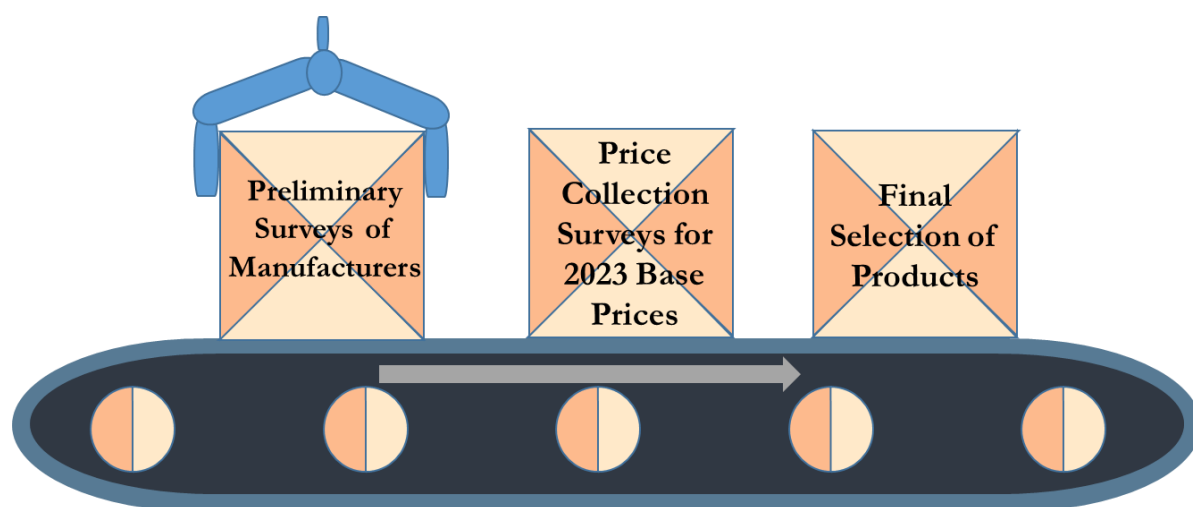

where the Linked Coefficient is the ratio of the annual 2023-based index in 2023 to the annual 2018-based index in 2023.

Example:

Annual 2023-based Index in 2023	= 100
Annual 2018-based Index in 2023	= 108
Linked Coefficient	= $100/108 = 0.926$
Thus, if a 2018-based Index in January 2022	= 111
Then the 2023-based Index in January 2022	= $111 \times 0.926 = 102.9$

III ITEMS AND PRODUCTS SELECTION

During the rebasing exercise, the products included in the SMPPI basket were reviewed and updated through the following processes:

Preliminary Survey of Manufacturers

The preliminary survey of manufacturers was initiated to collect characteristics of the commodity items sold by manufacturers, such as detailed information on the list of products, models or brands. The survey returns were used to shortlist the manufacturers and the commodity brands for subsequent price collections.

(i) Sampling Method

The initial sampling frame for the preliminary survey of manufacturers was the list of local producers from the 2020 CMA. The sampling frames were updated and supplemented by the 2021 CMA databases when they became available.

Purposive sampling was adopted in the 2023 rebasing exercise. This method ensured that commodity items that were significant were selected for the baskets of the rebased SMPPI thereby reduced the overall sample sizes of manufacturers without compromising the quality of the compiled price indices.

The SITC 7-digit commodity items were chosen based on the production shares within the various categories of products. The purposive sampling method involved progressive selections of SITC codes from the highest to the lowest levels of the SITC. The first step was to compile the weights at the 1-digit and 7-digit SITC levels. Within each commodity section starting from the 1-digit SITC, the corresponding 7-digit SITCs with relatively significant weights were selected from the sample. This approach ensured that only commodity items with significant contributions to the higher level SITCs were selected. After selection, the weights at the 2-digit and 3-digit SITC levels were aggregated from the selected 7-digit SITC codes.

The major manufacturers for each of the commodity items selected were then identified to take part in the preliminary survey to collect detailed product, model or brand specifications for subsequent product selections and price collections. Approximately 1,200 manufacturers were selected to participate in the preliminary survey.

(ii) Information Collected through the Preliminary Survey

The respondents were requested to provide detailed specifications/ descriptions of their key products for each commodity item stated in their customised survey forms. Information such as the brand, grade, size-measurement, type of packaging & other distinguishing features, frequency of production and unit of measurement were collected. Prices of manufactured products were quoted in ex-factory³ terms.

(iii) Selection of Manufacturers, Commodity Items and Products

The survey returns were reviewed, and where necessary, verified with the respondents to ensure that the products provided were within the scope of the selected commodity items. The selection of respondents and products for price collection was based on the following criteria:

- a) Production of the commodity items should be regular and frequent;
- b) Item descriptions should be specific and sufficiently detailed for price collection; and
- c) Selected products should constitute a significant share of the companies' production.

Price Collection Surveys

After the completion of preliminary survey, price surveys were then conducted at regular intervals to collect prices for the selected products from the manufacturers for the compilation of the base year price indices.

Selected manufacturers received customised survey forms with pre-printed descriptions of the selected commodity products, models or brands, as well as the previously provided prices of these items. These respondents then provided the latest prices for the products on the 15th of each month, or the nearest date.

Prices obtained were checked to ensure their reasonableness, consistency and accuracy. At compilation, all prices quoted in foreign currencies were converted to Singapore dollar using the prevailing average monthly exchange rates published by the Monetary Authority of Singapore. The prices of the selected products were monitored over a 12-month period. Products which could not be priced regularly or had volatile price trends were either removed or replaced.

³ An ex-factory price is where the seller makes goods available to the buyer at the seller's factory, and the buyer is responsible for paying for them to be transported to where they are needed.

Final Selection of Products and Coverage for the 2023-based SMPPI and DSPI

The number of prices collected for the compilation of the 2023-based SMPPI is shown in Figure 2. A total of 329 manufacturers were surveyed every month, from which 851 prices were collected for the compilation of 158 commodity items in the SMPPI.

Figure 2: Monthly Price Survey Coverage

	 Manufacturers Covered	 Commodity Items	 Prices Selected
Singapore Manufactured Product Price Index	329	158	851

The DSPI, a composite price index of SMPPI and IPI, is compiled from 119 commodity items from the SMPPI and 545 commodity items from the IPI. More information on the number of commodity divisions, groups and items for SMPPI and DSPI, is provided in Appendix II. The weights for the 2023 indices at the commodity section and group levels for the SMPPI and DSPI are presented in Appendices IIIA and IIIB respectively.

IV COMPARISON OF WEIGHTING PATTERNS AND PRICE TRENDS

Singapore Manufactured Products Price Index

Figure 3 illustrates the weights distribution of the 2023-based SMPPI. The Machinery & Transport Equipment and Chemicals & Chemical Products sections constituted a total of 70.6 per cent of the weights distribution.

Figure 3: Weights of the 2023-based SMPPI

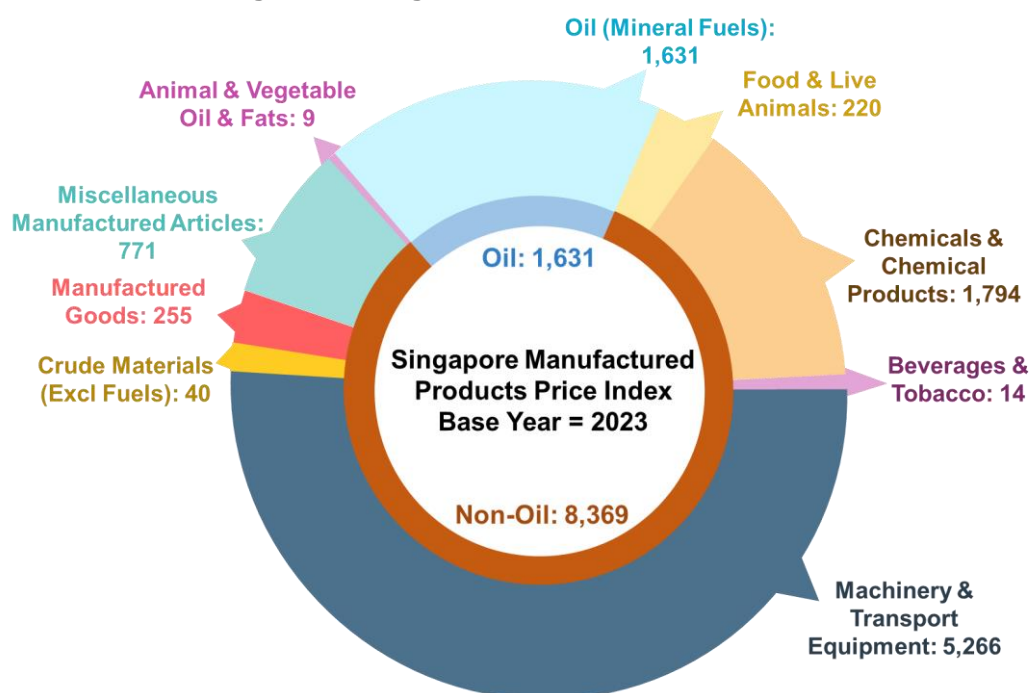

Table 1 lists and compares the rank order and differences in the 2023 and 2018-based SMPPI weights. The rank order for the commodity sections with the highest weights share remained the same.

Table 1: Weights Comparison and Rank Order of 2023-Based and 2018-Based SMPPI

Commodity Section	2023 Weights	2018 Weights	Difference	2023 Rank	2018 Rank
Machinery & Transport Equipment	5,266	4,897	+369	1	1
Chemicals & Chemical Products	1,794	2,165	-371	2	2
Oil (Mineral Fuels)	1,631	1,414	+217	3	3
Miscellaneous Manufactured Articles	771	883	-112	4	4
Manufactured Goods	255	284	-29	5	5
Food & Live Animals	220	256	-36	6	6
Crude Materials (Excl Fuels)	40	56	-16	7	7
Beverages & Tobacco	14	31	-17	8	8
Animal & Vegetable Oils, Fats & Waxes	9	14	-5	9	9

Figure 4 ranks the commodity sections based on the weights differences across the two base years. Having the highest weights share in the 2018-based index, the Machinery & Transport Equipment section increased 3.7 percentage points in the 2023-based series. This was due to higher contributions from telecommunications equipment.

The Oil (Mineral Fuels) section rose 2.2 percentage points, due to the rise in relative weights share of petroleum and petroleum-related products such as diesel fuel and kerosene.

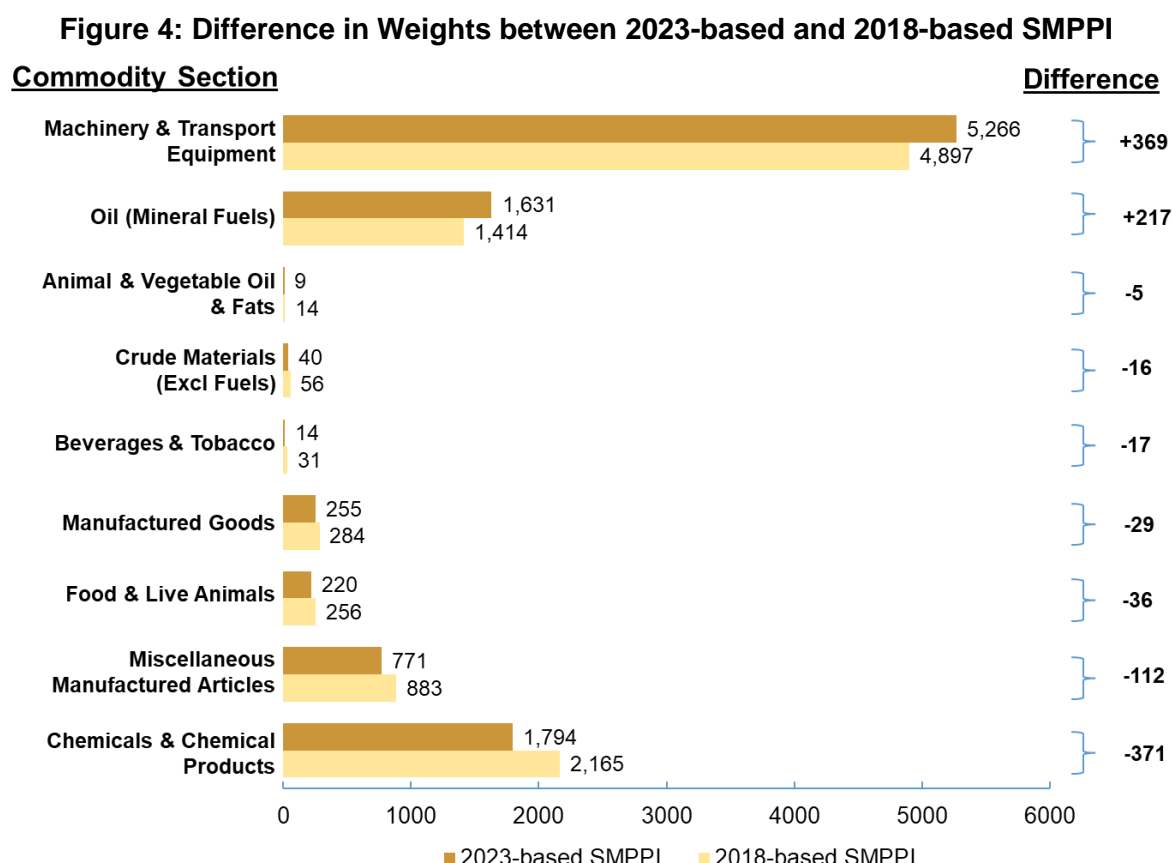

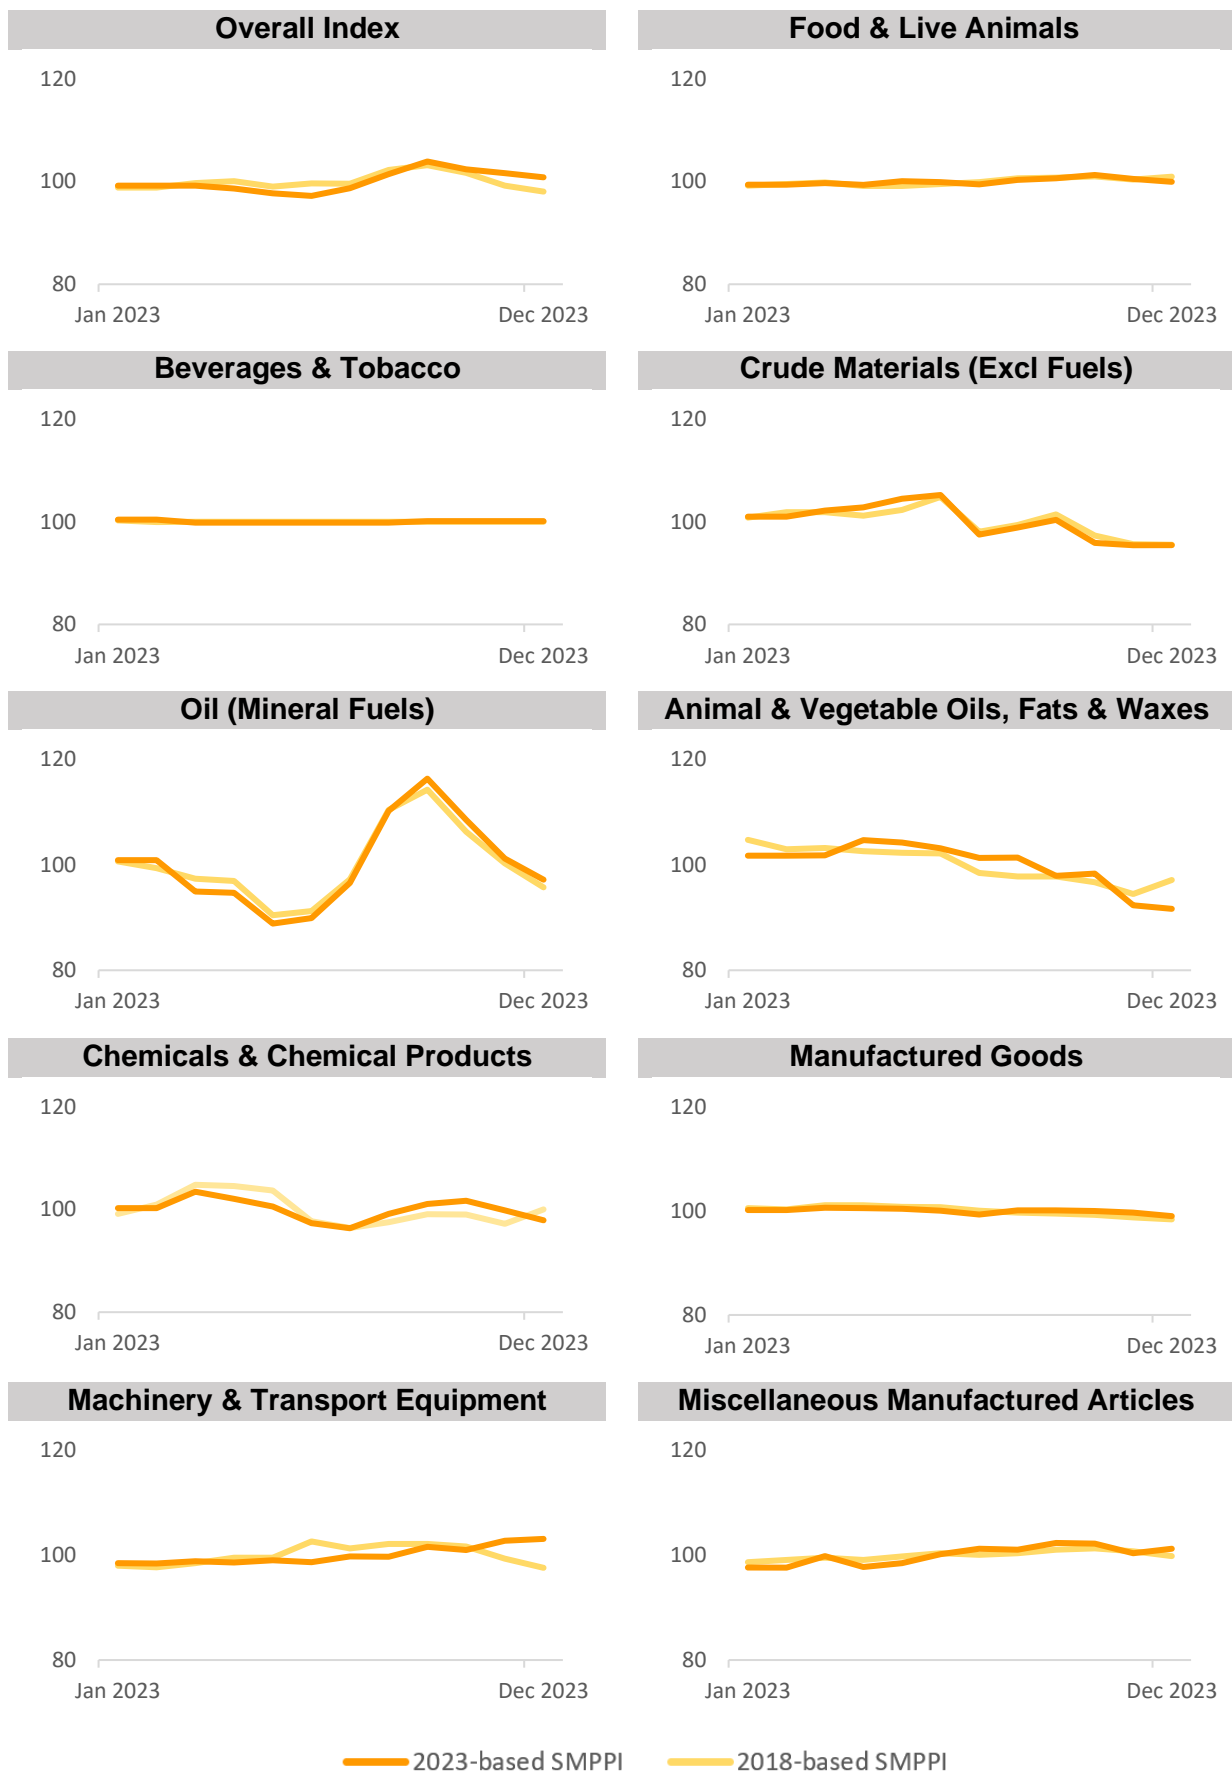

Figure 5 compares the price trends of the 2023-based and 2018-based SMPPIs by commodity section from January to December of 2023, the overlapping period between the two series. The price trends of the overall index for both base years generally moved in tandem, with slight differences in magnitude. This can be attributed to the Machinery & Transport Equipment section, due to its relatively large weight.

The 2023-based and 2018-based Machinery & Transport Equipment sections generally trended in the same direction. Slight differences can be attributed to changes in the basket of products, with a larger coverage of products in this section, coupled with changes in the weights composition, with telecommunications equipment taking on relatively higher weights in the new basket.

Figure 5: 2023-based and 2018-based SMPPI from January to December 2023

Domestic Supply Price Index

The weights distribution of the 2023-based DSPI is shown in Figure 6. The Machinery & Transport Equipment and Oil (Mineral Fuels) sections comprised the bulk (a total of 72.0 per cent) of the weights distribution.

Figure 6: Weights of the 2023-based DSPI

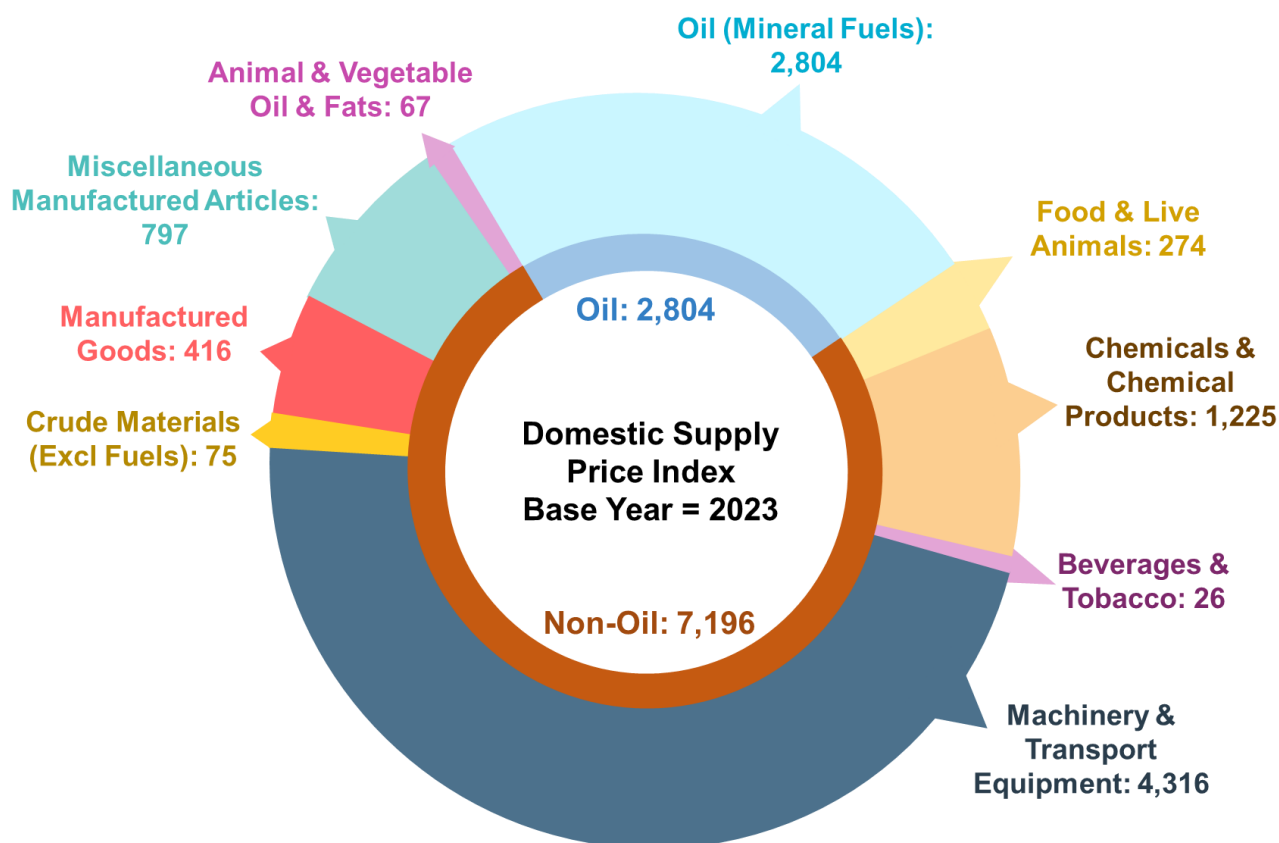

Table 2 lists and compares the rank order and differences in the 2023-based and 2018-based DSPI weights. The rank order for the top 7 sections remained the same across the two base years.

Table 2: Weights Comparison and Rank Order of 2023-Based and 2018-Based DSPI

Commodity Section	2023 Weights	2018 Weights	Difference	2023 Rank	2018 Rank
Machinery & Transport Equipment	4,316	4,302	+14	1	1
Oil (Mineral Fuels)	2,804	2,788	+16	2	2
Chemicals & Chemical Products	1,225	1,142	+83	3	3
Miscellaneous Manufactured Articles	797	802	-5	4	4
Manufactured Goods	416	490	-74	5	5
Food & Live Animals	274	319	-45	6	6
Crude Materials (Excl Fuels)	75	85	-10	7	7
Animal & Vegetable Oils, Fats & Waxes	67	43	+24	8	8
Beverages & Tobacco	26	30	-4	9	9

Figure 7 ranks the commodity sections based on the weights differences across the two base years. The weights of the 2023-based series were largely similar to those of the 2018-based series, with chemicals & chemical products registering the largest absolute increase and manufactured goods reflecting the largest decline.

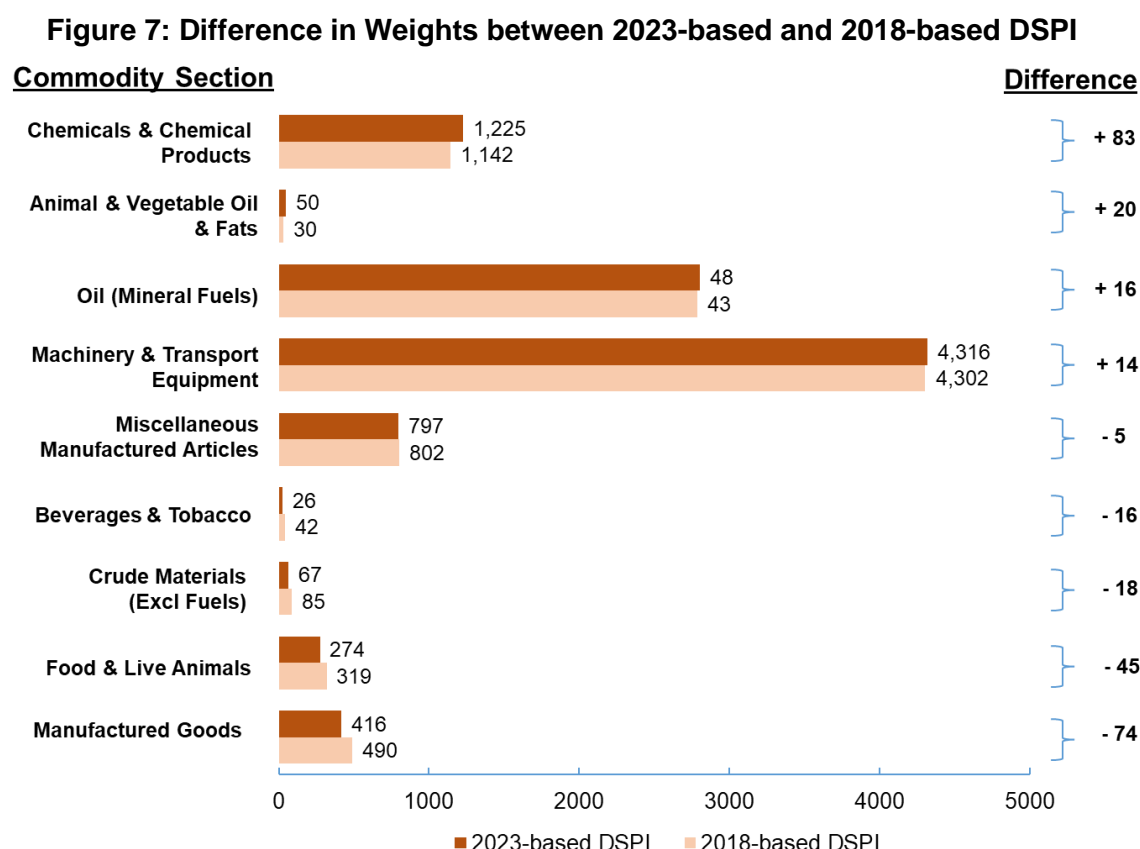

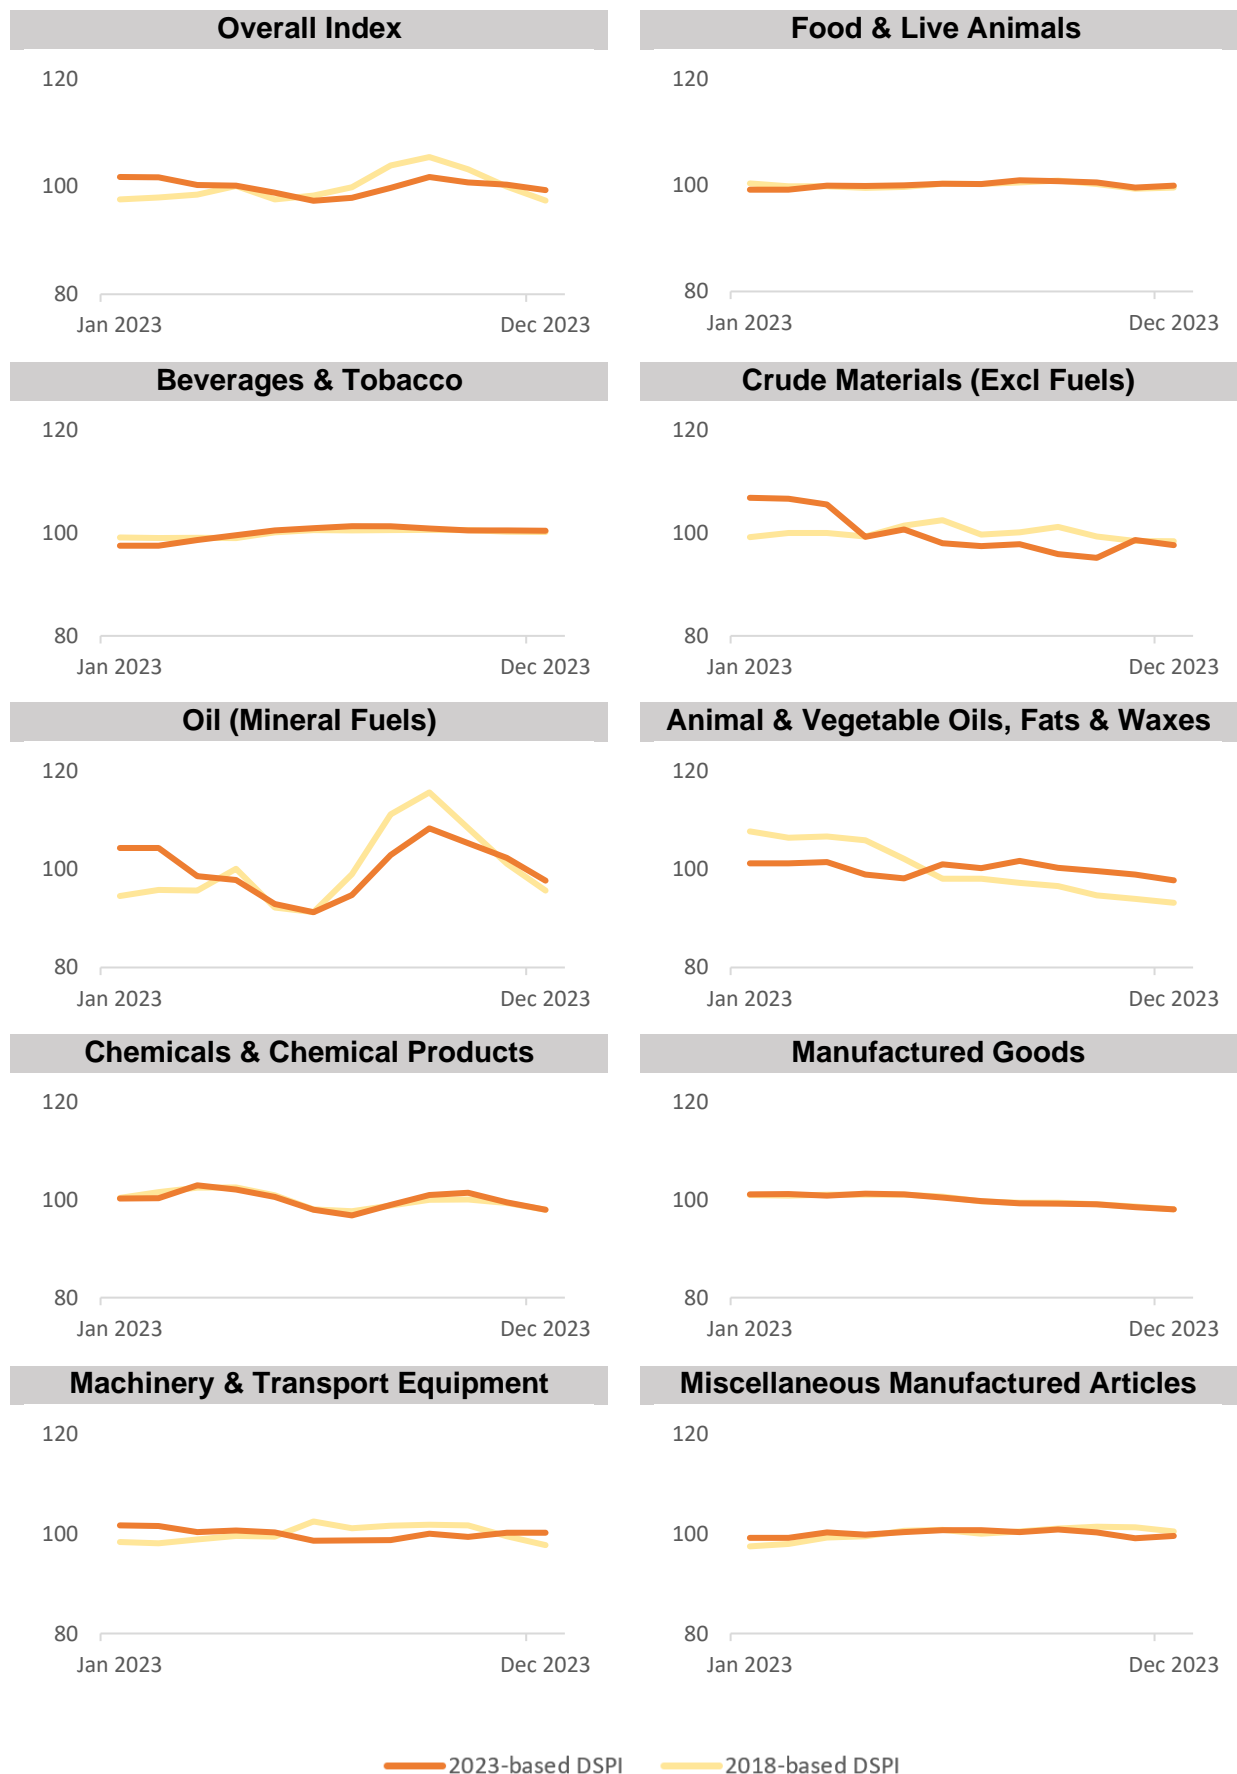

Figure 8 compares the price trends of the 2023-based and 2018-based DSPIs by commodity section from January to December of 2023, which is the overlapping period between the two series. The overall DSPI price trends of the two base years were similar, with slight differences in magnitude. This can be attributed to the Machinery & Transport Equipment and Oil (Mineral Fuels) sections, due to their relatively large weights. As domestic sales contributed the majority of its weights, the DSPI closely trended to the SMPPI.

V DISSEMINATION OF DATA

A monthly report on the SMPPI and DSPI is released on the SingStat Website (www.singstat.gov.sg/publications/economy/producer-price-indices) on the last working day or before the 29th day after the reference month. Data on the indices are available on the SingStat Table Builder (www.singstat.gov.sg/tablebuilder).

APPENDIX I:

Index Computation Method

Computation of SMPPI

- 1 The 2023-based SMPPI is compiled using the modified Laspeyres formula where the weight reference period of 2022 precedes the price reference period of 2023.
- 2 The price indices are built up progressively from the commodity brand to the item, group, division, section and overall levels. The price relative at the commodity brand level provides the basic level for the compilation of higher level (or more aggregated) indices.
- 3 The geometric means of these basic price relatives are obtained to form indices at the commodity item level. The weighted average of the price indices at the commodity item level is then used to form price indices at the group level. The process is repeated to obtain higher level indices including the division, section and overall price indices. The Laspeyres formula used for index computation is presented below:

Price Index at Commodity Brand Level: $I_{it} = P_{it}/P_{i0} \times 100$

Where, I_{it} = price relative of i-th commodity brand in period t relative to base period

P_{it} = price of i-th commodity brand in period t

P_{i0} = price of i-th commodity brand in the base period

Price Index at Commodity Item Level: $I_{jt} = \prod(I_{ijt})^{1/N}$

Where, I_{jt} = the price relative of the j-th commodity item in period t

N = the number of commodity brands within the j-th commodity item

Price Index at Commodity Group Level: $I_{kt} = \sum W_j \times I_{jt}$

Where, I_{kt} = the price relative of the k-th commodity group in period t

W_j = the relative weight of the j-th commodity item

$\sum W_j = 1$

Price Index at Commodity Division Level: $I_{mt} = \sum W_k \times I_{kt}$

Where, I_{mt} = price relative of the m-th commodity division in period t

W_k = the relative weight of the k-th commodity group

$\sum W_k = 1$

Price Index at Commodity Section Level: $I_{rt} = \sum W_m \times I_{mt}$

Where, I_{rt} = price relative of the r-th commodity section in period t

W_m = the relative weight of the m-th commodity division

$\sum W_m = 1$

Price Index at Overall Level: $I_t = \sum W_r \times I_{rt}$

Where, I_t = price index in period t

W_r = the relative weight of the r-th commodity section

$\sum W_r = 1$

Computation of DSPI

4 In computing the DSPI, it is necessary to compute its price relative at the commodity item (7-digit SITC) level. The price relative for a commodity item, D_{it} , in the DSPI is computed as follows:

$$D_{it} = k_i S_{it} + (1 - k_i) M_{it}$$

where

k_i is the proportion of supply of the i -th item from local source;

S_{it} is the price relative of the i -th item from the SMPPI (local component) for period t ;
and

M_{it} is the price relative of the i -th item from the IPI (imported component) for period t .

5 Once the commodity item price relative for the DSPI is computed, the various price indices at higher aggregated levels can be computed as in the SMPPI.
